# AIRSTREAM

A TRAILERING GUIDE

INTRODUCTION 2006 MODEL

The **Owners Manual** for your new Airstream trailer is designed to respond to the most frequent inquiries regarding the operation, function and care of the many systems that make modern trailering a joy.

Airstream realizes our customers possess varying degrees of expertise in the area of repairing and maintaining the appliances in their trailer. For this reason, the service and trouble-shooting information found in this manual is directed toward those with average mechanical skills. We also realize you may be more familiar in one area than you are in another. Only you know your capabilities and limitations.

We want you to use this manual, and hope you will find the information contained in it useful, however, should you ever feel you may be "getting in over your head" please see your dealer to have the repairs made.

A brief explanation of the operation of the appliances such as refrigerator, furnace, water heater and others are explained in this manual. However, you will also find the manufacturer's information supplied in a packet included with this manual more detailed.

All information, illustrations and specifications contained in the literature are based on the latest product information available at the time of publication approval.

Throughout this manual **CAUTION** and **WARNING** notations are used.

Failure to observe "CAUTION" can damage equipment.

**WARNING** notes the possibility of personal and/or fatal injury if not observed.

Note: If and when new materials and production techniques are developed which can improve the quality of its product, or material substitutions are necessary due to availability, Airstream reserves the right to make such changes.

#### WARRANTY COVERAGE

When you buy a new Airstream Travel Trailer from an authorized Airstream dealer, Airstream, Inc., warrants the trailer from defects in material and workmanship as follows:

#### **BASIC WARRANTY PERIOD**

This warranty extends for a period of two years from the date of original retail purchase.

#### ITEMS COVERED

Any part of the trailer or any component equipment installed by the factory is covered by the basic warranty except the following items, which are not covered:

- Tires
- Batteries

The tire and battery warranties will be handled by their respective service points and according to their written policy. This limited warranty does not include failure caused by accident, abuse, normal wear, overload or any cause not attributable to a defect in original material or workmanship of the trailer or component equipment as installed by the factory.

#### LIMITATION OF IMPLIED WARRANTIES

All warranties of merchantability and fitness for a particular purpose, whether written or oral, expressed or implied, shall extend only for a period of two years from the date of original purchase. There are no other warranties, which extend beyond those described on the face hereof and which expressly excludes conditions resulting from normal wear, accident, abuse, exposure or overload. Some states do not allow limitation on how long an implied warranty lasts, so the above limitations may not apply to you.

#### AIRSTREAM'S RESPONSIBILITY

The basic **Airstream Limited Warranty** applies for a period of two years from the date of original purchase, and the application date of all warranties is that indicated on the owner's Limited Warranty. Defects in items covered under this Warranty will be corrected without cost upon the return, at the owner's expense, of the trailer or defective part to an authorized Airstream dealer.

#### **CARE AND MAINTENANCE**

This warranty covers only defective material and/or workmanship; adjustments are made at the factory prior to shipment, and rechecked by the dealer prior to delivery to the customer. Adjustments thereafter become a customer responsibility.

Each Airstream exterior (excluding the underside and white roof) is clear coated to prevent oxidation. This application is covered by a two-year warranty against peeling. Prolonged exposure to salt air or industrial fall-out will permit penetration through the coating material, causing damage to the exterior finish. Since Airstream, Inc., has no control over these conditions, it is necessary for the owner to wash and maintain their trailer as instructed in the Owner's Manual.

The owner is also responsible for following all recommendations, instructions and precautions contained in the Airstream Trailer Owner's Manual and the individual manuals furnished by the chassis, appliance and other manufacturers.

#### **INSTALLATIONS NOT COVERED**

Airstream, Inc., does not accept any responsibility in connection with any of its trailers for additional equipment or accessories installed at any dealership or other place of business, or by any other party. Such installation of equipment or accessories by any other party will not be covered by the terms of this warranty.

#### IF REPAIRS ARE NEEDED

If your trailer needs repairs under the terms of the basic Airstream Limited Warranty, you should:

- 1. Take your trailer to your selling dealer or other Authorized Airstream Dealer.
- If the dealer is incapable of making the repair, request that he contact the Service Administration Department at Airstream, Inc., for technical assistance.
- 3. If repairs are still not made, the customer should contact:

#### AIRSTREAM, INC.

419 W. Pike Street - P.O. Box 629

Jackson Center, Ohio 45334-0629

Attention: Owner Relations Department

Furnish the following information:

- The complete serial number of the trailer
- Mileage
- · Date of original purchase
- Selling dealer
- Nature of service problem and steps or service, which have been performed.
   (The owner may be directed to another dealer at the owner's expense.)
- 4. If, after taking the above steps, repairs are still not complete, the Airstream owner may request the trailer be brought to the Factory Service Center at the owner's expense.

#### **DEALER REPRESENTATION EXCLUDED**

The full extent of the basic **Airstream Limited Warranty** is set forth in detail in the folder, and in the explanation of the basic **Airstream Limited Warranty** covered in the Airstream Trailer Owner's Manual. Airstream Inc. will not be responsible for additional representations or implied warranties made by any of its dealers to the extent those representations are not a part of, or are contrary to, the terms and conditions of the basic Airstream Limited Warranty.

#### **CONSEQUENTIAL AND INCIDENTAL DAMAGES**

Airstream, Inc., will not be responsible for any consequential or incidental expenses or damages resulting from a defect. Incidental expenses include, but are not limited to: travel expenses, gasoline, oil, lodging, meals, telephone tolls, and loss of work and loss of use of the trailer. Some examples of consequential damages would be: stained curtains due to rain leaks or delaminated floor caused by a plumbing leak. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.

#### **WARRANTY TRANSFER**

The basic **Airstream Limited Warranty** is transferable to subsequent owners for the duration of the warranty period. Warranty transfer application forms are available from your dealer or the Airstream Inc. Service Administration Department.

#### **CHANGES IN DESIGN**

Airstream Inc. reserves the right to make changes in design and improvements upon its product without imposing my obligation upon itself to install the same upon its products theretofore manufactured.

This warranty gives you specific legal rights, and you may also have other rights, which vary from state to state.

#### **EXPLANATION OF AIRSTREAM LIMITED WARRANTY**

The Airstream Limited Warranty is detailed on your warranty document.. It is filled out by the dealer and presented to the owner during delivery of a new unit. The Limited Warranty must be presented to a dealer to obtain warranty service. It should be kept in the trailer during the warranty period.

#### **EXCLUSIONS:**

#### **Normal Wear**

Items such as tires, water purifier packs, curtains, upholstery, floor coverings, window, door and vent seals will show wear or may even wear out within the two year warranty period depending upon the amount of usage, weather, and atmospheric conditions.

#### Accident

We strongly urge our dealers and customers to inspect the trailer upon receipt of delivery for any damage caused by accident while being delivered to the dealer, or while it is on the dealer's lot. Damage of this nature becomes the dealer or customer's responsibility upon acceptance of delivery, unless Airstream is notified and the person making the delivery verifies the damage. Glass breakage, whether obviously struck or mysterious, is always accidental and covered by most insurance policies.

#### Abuse

Lack of customer care and/or improper maintenance will result in early failure for which Airstream cannot be held responsible.

#### Exposure

Not unlike a car, the steel parts of a trailer can and will rust if subjected to prolonged

exposure to moisture, salt air, or corrosive air-borne pollutants without repainting. Aluminum oxidizes when unprotected under similar conditions, and refinery chemicals of a sulfurous nature are harmful to finishes if not washed off periodically. Extremely hot or direct sunlight will deteriorate rubber and fade curtains and upholstery. Conditions of this nature, although they may be normal for the area, are beyond Airstream's control and become the responsibility of the owner.

Although it is our obligation to correct a rain or plumbing leak within the terms of the limited warranty, it is the owner's responsibility to use reasonable, prudent care to minimize foreseeable secondary damage, such as a delaminated floor, stained upholstery, carpeting, drapes etc.

#### Overload

Damage due to loading, either beyond capacity or to cause improper towing because of improper balance, is beyond Airstream's responsibility. The Airstream trailer is engineered to properly handle the gross vehicle load rating on the certification label. Load distribution has a definite effect upon the towing characteristics and attitudes of the trailer. Level hitch installations are a necessity, and very important on a tandem axle trailer. There are limits to the amount of load that can be safely transported depending upon speed and road conditions, and reasonable cause to believe these factors have been exceeded could void the Airstream warranty. For additional information on the loading of your trailer, consult your Owner's Manual or gross vehicle weight rating plate.

The axles used on your trailer is manufactured to a tolerance of 1-degree camber and 1/8" toe-in. These tolerances will only change if the trailer is subjected to abuse, such as dropping off a sharp berm, striking a curb, or hitting a deep hole in the road. Such damage could be considered as resulting from an accident which risks are not covered under the warranty. Abnormal tire wear and/or wheel alignment resulting from such damage is not covered under the terms of the warranty.

#### SERVICE:

The Airstream Silver Key Delivery Program is an exclusive Airstream program. Before leaving the factory, each and every vital part of the trailer is tested for performance. Each test is signed and certified by an inspector. After the trailer arrives on your dealer's lot all of these vital parts and systems are again tested. When you take delivery of your new trailer you will receive a complete check out.

Silver Key Delivery does not stop here. At that time a specified list of performance checks on your trailer equipment will be conducted and any deficiencies you have experienced since taking delivery will be corrected.

Please contact your dealer if you need service. Major service under your Airstream Limited Warranty is available through our nationwide network of Airstream Dealer Service Centers. An up-to-date list of Dealer Service Centers has been provided with your new trailer. This list is current as of the date of this publication.

Occasionally dealerships change, or new dealers are added who may not appear on this list. For this reason, it is suggested that you contact your local dealer from time to time and bring your list up to date. He can also provide you with additional copies if you need them. ALL CENTERS OPERATE ON AN APPOINTMENT BASIS FOR THE UTMOST EFFICIENCY.

When you require service from the Airstream Factory Service Center, or a Certified Dealer Service Center, please contact the service manager for an appointment, and kindly inform him if you are unable to keep the appointment date or wish to change it. Service may be arranged at the Factory Service Center by contacting the Service Coordinator at:

Airstream Factory Service Center P.O. Box 629 419 W. Pike Street Jackson Center, Ohio 45334-0629 937-596-6111

#### REPORTING SAFETY DEFECTS

If you believe that your vehicle has a defect, which could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying Airstream, Inc.

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or Airstream, Inc.

To contact NHTSA you may either call the Auto Safety Hotline toll-free at 1-800-327-4236 (TTY 1-800-424-9153) or write to: NHTSA, 400Seventh ST, S.W., Washington, D.C. 20590.

You can also obtain other information about motor vehicle safety from the Hotline or view the NHTSA Website: www.safecar.gov

#### **MAINTENANCE SCHEDULE**

WARNING: FAILURE TO MAINTAIN YOUR COACH CAN CAUSE PREMATURE AND UNEXPECTED PARTS BREAKAGE AND/OR ERRATIC OPERATION THAT MAY BE HAZARDOUS.

Note: See appliance manufacturer's literature for further information

#### SUGGESTED MAINTENANCE

#### **EVERY 1,000 MILES OR 60 DAYS**

**Exterior Hinges Escape Window** Check operation of latches and upper hinge.

\*Battery Check water level LPG Hold Down Lubricate with light household oil

Smoke Alarm Test and replace battery as required LPG Regulator Check bottom vent for obstructions

Tires Check tire pressure (See Specifications) Main Door Striker Pocket Coat with paraffin.

Hitch Check for loose bolts or unusual wear. Wheel Lug Nuts Torque forged aluminum wheels to 110-120 Ft. lbs.

7-Way Plug

Hitch Ball Latch

and steel wheels to 95 ft. lbs.

Spray with contact cleaner.

Lubricate with dry graphite

Lubricate with light household oil

Pull pin and lubricate with household oil Break Away Switch

GFI Circuit Breaker

### **WARNING: WHEEL SEPARATION CAN OCCUR**

1. On first trip, tighten wheel lugs at start and at 10, 25, and 50 miles.

Test and record.

- 2. Thereafter, check whell lugs before each trip.
- 3. Following winter storage, check before beginning a trip.
- 4. Following excessive braking, inspect wheel lugs

Torque forged aluminum wheels to 110-120 Ft. lbs. and steel wheels to 95 ft. lbs.

**EVERY 5,000 MILES OR 90 DAYS** 

**Exterior Door locks** 

Lubricate with non-detergent motor oil

Hitch Ball Lubricate with hitch ball lube or wheel bearing grease.

Clean fan blades and wash filter. Range Exhaust Hood

Roof Vent Elevator Screws Lubricate with light household oil

Main Door Step Lubricate moving parts and check.

<sup>\*</sup> As a battery ages and becomes less efficient, the water level should be checked at more frequent levels.

EVERY 10, 000 MILES OR	6 MONTHS	EVERY YEAR			
Brakes	Inspect, adjust or replace as necessary	Battery	Clean, neutralize and coat terminals with petroleum jelly.		
Wheel Bearings	Clean and repack	A-Frame, Step	Wire brush and paint frame at front and rear.		
Tires	Inspect and rotate	A Franc, Otop	who brush and paint frame at front and real.		
Spare Tire Carrier	Lubricate moving parts.	LP Bottles	Have purged by LP supplier.		
Cools Windows & Door	Clear with wild detergent and part with "Clinicane"	Seams	Check and reseal exterior seams, windows,		
Seals, Windows & Door	Clean with mild detergent and coat with "Slipicone".		lights and vents if necessary. Use Ten X or equivalent.		
TV Antenna	Lubricate all moving parts with silicone lubricant.	Hitch Coupler and Ball	Check for wear or damage. Assure all parts operate freely. Replace any component if		
Exterior	Wax		worn or damaged.		
Escape Window	Lubricate latches with WD-40.				

#### PARTS AND LUBRICANTS

#### **BULBS, EXTERIOR**

Taillight LED
Back Up LED

License Plate # 53, wedge base
Hitch Light # 53, wedge base

Clearance Light # 67

Door Light # 1003

Hitch Light # 193, wedge base

Oil Can with 30 Weight Non-Detergent Oil

Silicone Lubricant

Light Household Type Oil

Spray Contact Cleaner

Hitch Ball Lube (wheel flush grease)

Sealer

C-Cell Batieries (Door Bell)

### MAINTENANCE RECORD

DATE	DEALER	SERVICE PERFORMED

#### **TOWING YOUR AIRSTREAM**

#### TOW VEHICLE EQUIPMENT

If you plan to buy a new vehicle to tow your trailer we suggest that you include in your purchase the towing options offered by most vehicle manufacturers. These include such things a heavy-duty alternator and radiator, heavy-duty springs, (See Note:) shock absorbers, transmission cooler, heavy-duty fan and flasher unit and others, depending upon the make of the vehicle.

**NOTE:** Be realistic when ordering heavy duty springs. Only springs heavy enough to support your loaded vehicle (not including trailer) are necessary. Too harsh of spring rate will only shorten the life of the tow vehicle and trailer, and will make your journeys less enjoyable.

Transmissions may be manual or automatic, but an automatic transmission may prolong your tow vehicle's life and generally does a better job of controlling engine loads than the average driver using a manual shift.

Having adequate power is very important when considering the purchase of a new vehicle or the trailer towing capability of your present one. American manufacturers

realize more than 30% of the vehicles they sell will be used for towing some type of trailer. The dealers are provided with guidelines to use when helping a customer decide on a tow vehicle. The guidelines are not just determined by the power output of the engine. The gear ratio of the differential is also a very part of the guideline.

Inspect vehicle's hitch regularly for loose bolts or nuts, cracked welds, loose ball mounts, worn parts, etc.

New trailerists often carry more food and other supplies than really needed. Remember that every item you take along is one more thing to stow and adds weight to the total load you must pull. Consolidate items in shelves, lockers, and in the refrigerator. It is better to have one full and one empty locker, than two half empty ones. Special care must be taken not to overload the front and rear ends of the trailer.

#### **Disc Brakes**

The disc brake system is a proven system that includes a ventilated rotor that fits over the hub, combined with a caliper and mounting bracket that attach to the axle end assembly by bolting to the standard brake flange. Major automobile manufacturers and others have used this type of rotor installation for many years. The wheel studs are pressed into the hub only. The rotor is a loose fit on the hub, is centered by the wheel bolts, and is retained by the wheel, which in turn is retained by the wheel nuts. Removal of the rotor can be accomplished with little effort once the caliper has been removed.

#### **Safety Information**

- 1. Only qualified persons who are knowledgeable of brakes and brake systems should perform brake installation, maintenance or repair on any vehicle.
- Familiarize yourself with state laws regarding the operation of towed vehicles, especially with regards to brake/braking requirements. Allow for extra stopping distance that may be required when towing.
- 3. Immediately after each hook up, always test that the trailer brakes are operating properly before attaining normal road speed.
- 4. Make regular, periodic inspections of your trailer brakes. The inspection should include:
  - a. Pads for evidence of excessive or uneven wear.
  - b. Rotors for evidence of excessive wear, scoring, excessive heat build up, cracks, warpage.
  - c. Actibrake Master Cylinder proper fluid levels.
  - d. All bolted connections tight
  - e. Calipers and Brake Lines for evidence of brake fluid leak.

#### **Preventive Maintenance**

- 1. Visually check brakes before each trip. See item 4 in safety Information.
- 2. After each hook-up, always check trailer brake operation before attaining normal driving speed.
- Follow manufacturer's recommendations with regard to use of and replacement of brake fluid.
- Wash down brake assembly immediately after exposure to salt water or other corrosives.
- 5. Periodically, during each trip, check hub and assemblies to make sure that they are within normal operating ranges (130°- 175° F). Do not touch brake components, as they may be much hotter than the hub or wheel, especially after recent braking.

#### **Actibrake Disc Brake Actuator System**

ActiBrake is part of a trailer braking system. ActiBrake is a state-of-the-art trailer brake actuator. ActiBrake is the fastest responding, most advanced electric-hydraulic pump actuator available.

#### **Brake Controllers**

Your trailer braking system is like a chain. It is only as good as its weakest link. This is especially true regarding tow vehicle brake controllers. There are many marginal brake controllers on the market, and ActiBrake will only apply the level of braking indicated by the brake controller's "blue wire" signal. Therefore, we urge you not to economize on a brake controller because it will only diminish the overall performance of ActiBrake and your trailer braking system in general. Unlike electric drum brakes, the ActiBrake does not receive its power through the "blue wire". The power to the ActiBrake is

provided through a +12 volt (normally black) wire from the tow vehicle connector.

The heart of ActiBrake is the Power Max pump. It is the highest capacity pump available on any electric-hydraulic pump actuator.

ActiBrake is also the only electric-hydraulic actuator with the unique "Extend'A Hold" feature which maintains brake line pressure when the vehicle is stopped without operating the motor. This dramatically reduces heat build-up and improves reliability and longevity.

#### Filling Reservoir

Fill the reservoir with NEW, CLEAN, "DOT 3" or "DOT 4" Brake Fluid. Never re-use brake fluid that has been salvaged or removed from another unit. Contaminated or dirty fluid can cause system failure and/or premature wear on the system components. DO NOT OVER FILL the reservoir. Fill within 3/8-inch of the filler opening.

Use only new, clean, DOT 3 or DOT 4 brake fluid from a sealed container. Do not fill with previously used fluid. Used fluid may absorb water or other impurities which may cause corrosion and/or poor brake performance. This may result in physical injury and/or property damage!

It is critical that you verify that your breakaway system functions properly! The breakaway battery is the trailer batteries. The breakaway switch is wired direct to the batteries.

#### **Breakaway Protection**

The breakaway system is required to supply power to the ActiBrake system in the event the trailer becomes uncoupled from the towing vehicle.

Failure to maintain adequate charge in the breakaway battery will result in the breakaway system not functioning properly. This may result in physical injury and/or property damage in the event of a breakaway! The breakaway battery is the trailer batteries. The breakaway switch is wired direct to the batteries.

**General Operation** 

#### Coupling

When coupling the trailer to the towing vehicle, always ensure the two vehicles are properly coupled, including the safety chains and breakaway switch cable, in accordance with the vehicle manufacturer's instructions and trailer manufacturer's instructions. All coupling devices and procedures must conform to State and Federal regulations.

#### **Trailer Connector - Vehicle Connector**

After properly coupling the trailer to the towing vehicle, plug-in the trailer connector to the mating connector of the towing vehicle. There are two checks to ensure proper connection has been made.

(The first time the ActiBrake is connected to a brake controller, it is necessary to engage the manual over-ride lever of the brake controller for a period of up to 5 seconds. During this time, ActiBrake's active synchronization system syncs-up with your brake controller. ActiBrake stores this information in its memory so the synchronization is necessary only at initial set-up AND whenever the trailer gets disconnected and reconnected to the tow vehicle.)

The first check is visual, as many tow vehicle brake controllers have an indicator light. This light will illuminate green if the electrical connection is correct. If the light does not illuminate, there is a problem with the connection. SEE your tow vehicle brake controller manual for complete details on verification of wiring continuity.

B

The second check requires using the manual override lever on the tow vehicle controller. Position a second person near the ActiBrake. With the ignition switch turn on, keeping the vehicle in Park (or not in gear with the parking brake engaged) and stationary, move the manual override lever of the brake controller. The person near the ActiBrake will hear the motor engage if the tow vehicle and trailer are properly connected. If the ActiBrake does not function, immediately discontinue operation.

#### **Determining and Setting Proper Trailer Braking Force**

#### Become Familiar with Braking of the Coupled Tow Vehicle and Trailer.

After the system installation has been verified, the operator should take the trailer to an empty parking lot to become familiar with the operation of the braking action of the combined tow vehicle-trailer. Each driver has different driving habits, and each vehicle has unique braking characteristics. Each potential driver of the coupled tow vehicle and trailer should take some time to familiarize themselves with the response and handling of the trailer using various settings on the tow vehicle controller. Each driver must be familiar with the operation of the tow vehicle brake controller and understand how to make adjustments to achieve the most desirable braking force.

Brake Controller Signal Determines Trailer Brake Pressure

Trailer braking pressure is controlled by the use of a tow vehicle brake controller. This allows the driver to select the desired brake performance for the trailer, from the driver's position in the towing vehicle. Increasing or decreasing the "gain" setting of the tow vehicle brake controller, will increase or decrease the level of brake force generated by the ActiBrake unit. Refer to brake controller manufacturer's manual for instructions to properly adjust the controller settings.

#### Which Tow vehicle Controller Is Best?

The ActiBrake will operate in conjunction with any state-of-the-art tow vehicle brake

controller. A controller that obtains its signal directly from the towing vehicle's braking system is preferred. A high quality inertia based controller using accelerometer technology is second preference. Third preference is a high quality inertia based controller using a pendulum to sense deceleration.

NOTE: Active Technology does not endorse the use of time-based tow vehicle controllers with the ActiBrake system. The output of a time-based controller is not proportional to the deceleration of the towing vehicle and therefore, when linked to a time-based tow vehicle controller, ActiBrake will not generate proportional brake pressure.

#### Settings and Use of Tow vehicle Controllers

The settings of the tow vehicle controller are set by the driver. When properly set, the braking force of the trailer will provide sufficient braking so the brakes of the towing vehicle are not required to provide any braking force for the trailer. Variations in the controller settings may be required for different road conditions and for changes in trailer load. It is essential to maintain sufficient braking on the trailer on wet or slippery road surfaces. More braking with the trailer will help prevent the possibility of a jack-knife situation or prevent the trailer from swaying or pushing the towing vehicle. The tow vehicle brake controller also allows for manual activation of the trailer brakes independent of the tow vehicle, by using the manual override feature of the controller.

**WARNING:** It is essential that each driver read and fully understand the tow vehicle brake controller operating manual provided by the manufacturer of the tow vehicle brake controller. Failure to fully understand the use and operation of the tow vehicle brake controller by each driver may cause loss of vehicle control. This may result in physical injury and/or property damage!

#### DO NOT RIDE YOUR BRAKE PEDAL!

This will cause constant pressure from the ActiBrake unit to the trailer brakes, resulting in premature wear and overheating. This may also cause damage to the ActiBrake unit or cause damage to the internal components of the system, as well as damage to your hydraulic brakes.

Extend'A-Hold Feature

In the event you are required to be stopped with the tow vehicle brake pedal depressed for an extended period (and if the brake controller installed in your tow vehicle continues to send a signal when your vehicle has stopped), the ActiBrake unit's "Extend'A Hold" feature is activated. This Extend'A Hold feature shuts the motor off after approximately 20 seconds and keeps your brake lines pressurized until you release the brake pedal in the towing vehicle. The motor will re-start for a few seconds every 30 seconds to maintain brake line pressure until the tow vehicle brake pedal is released.

**Important!** Do not remove the plastic cover of the ActiBrake. It is sealed against moisture and other contaminant's and to prevent tampering with internal components. Removing this cover voids your warranty.

#### **Replacement Parts**

The internal components of the ActiBrake unit are not intended for field service. The unit is sealed at the factory to prevent tampering with the internal components. The ActiBrake warranty will be voided if the seal is broken. See your dealer for replacement breakaway switches, batteries, filler cap or other items for your brake system.

**Important:** Brake fluid can cause damage to painted surfaces. Clean up any spills on painted surfaces immediately.

#### **Service and Maintenance**

#### **Visual System Check**

Periodically check the complete braking system, including the brake lines and hoses, wiring and vehicle-trailer connector plugs for damage, corrosion or leaks. Ensure brake lines and wires are secured so they do not hang down, drag or get caught when the trailer is in motion.

#### Make Sure The Breakaway Battery Is Fully Charged

Always check the breakaway battery to verify it is fully charged when coupling your trailer for use. The breakaway battery is the trailer batteries. The breakaway switch is wired direct to the batteries. The trailer systems monitor will show the batteries charge status. Plug you shoreline into an exterior 110-volt service or running your tow vehicle with the 7-way cord connected will charge your trailer batteries.

Failure to maintain proper charge in the breakaway battery will result in the breakaway system not functioning properly. This may result in physical injury and/or property damage in the event of a breakaway!

#### **Charge Battery When Necessary**

If battery's charge is low, or if the trailer has been parked for a prolonged period, charge the battery by connecting the trailer 110-volt shoreline or running the tow vehicle with the 7-way cord connected. Use the procedure outlined above to determine if the breakaway battery is fully charged. Always follow battery manufacturer's maintenance instructions.

Testing the battery in the manner outlined above confirms that the battery is charged. However, it does NOT confirm the brakes are functioning properly. Regular inspection, adjustment, and maintenance of the braking system is necessary to ensure proper brake operation.

#### **Check Brake Fluid Level**

Verify brake fluid level before each use. Fluid level should be between three eights and one half inch from the top of the filler tube. Use care to prevent contamination of the fluid with dirt, water, or other foreign material when removing the filler cap, checking the fluid level, or when adding fluid to the reservoir.

#### **Brake Fluid Contamination**

The ActiBrake reservoir is sealed to prevent contamination of the fluid during normal operation. Should the fluid in the reservoir become contaminated, the ActiBrake and brake system should be flushed. This procedure should ONLY be performed by a qualified mechanic or technician. After the system has been flushed, the reservoir must be re-filled with new "DOT 3" or "DOT 4" brake fluid and the brake lines bled as outlined of Page 8 of the Actibrake Owner's Manual. The use of contaminated brake fluid may cause the ActiBrake system to malfunction, which may result in physical injury and/or property damage!

See the Actibrake manual included with your owner's packet for troubleshooting,

Active Technology 7600 Sand Drive Fort Worth, Texas 76118 817-595-9710 www.activetech1.com

WARNING: NEVER CRAWL UNDER YOUR TRAILER UNLESS IT IS RESTING ON PROPERLY PLACED JACK STANDS.

A **BRAKE CONTROLLER** installed in your tow vehicle will synchronize the trailer brakes with your tow vehicle brakes. It is designed to apply the trailer brakes whenever the tow vehicle brakes are applied.

**ELECTRONIC CONTROLLERS** are inertially activated. The controller senses deceleration and generates an output, which reflects the inertia sensed. When you are stationary, the controller does not apply the brakes unless the manual slide bar is activated.

NOTE: Study all material provided with your particular brake control. If you don't understand the information, have the installer explain the information to you or call the manufacturer of the controller.

In **THE EVENT OF AN ACCIDENTAL SEPARATION** of the tow vehicle and trailer, the BREAKAWAY SWITCH will set and lock the trailer brakes for a sufficient length of time to stop the trailer. The switch is activated when the wire attached to it and to the tow vehicle pulls out the small pin in the front of the unit. THIS PIN SHOULD BE PULLED OUT, LUBRICATED WITH LIGHT HOUSEHOLD OIL AND REPLACED EVERY 90 DAYS.

To prevent corrosion within the breakaway switch, pull the switch's pin straight forward and spray the inside of the switch through the hole with an electric contact cleaner (such as Spra- Kleen) and reinsert the pin. A drop of light household oil on the groove near the base of the pin will allow the pin to operate freely. WHEN THE TRAILER IS CONNECTED TO THE TOW CAR, THE BREAKAWAY SWITCH LOOP SHOULD BE ATTACHED TO THE PERMANENT FRAME OF YOUR HITCH. When disconnecting trailer from tow vehicle remove wire loop from the frame. DO NOT REMOVE THE PIN FROM THE SWITCH FOR AN EXTENDED PERIOD OF TIME BECAUSE THIS WILL APPLY THE TRAILER BRAKES AND POSSIBLY DAMAGE THE BRAKE MAGNETS AND RUN THE BATTERY DOWN.

**CAUTION:** Do not use breakaway switch for parking brake.

#### LOADING

Below is a sample of the weight information chart provided in all Airstream vehicles. This information can be found in your vehicle on the back of the first wardrobe door on the curbside of the vehicle about 60" up from the floor.

#### TRAILER WEIGHT INFORMATION

#### **VIN OR SERIAL NUMBER**

GVWR (GROSS VEHICLE WEIGHT RATING) IS THE MAXIMUM PERMISSIBLE WEIGHT OF THIS TRAILER WHEN FULLY LOADED. IT INCLUDES ALL WEIGHT AT THE TRAILER AXLE(S) AND TONGUE OR PIN.

UVW (UNLOADED VEHICLE WEIGHT) IS THE WEIGHT OF THIS TRAILER AS MANUFACTURED AT THE FACTORY. IT INCLUDES ALL WEIGHT AT THE TRAILER AXLE(S) AND TONGUE OR PIN. IF APPLICABLE, IT ALSO INCLUDES FULL GENERATOR FLUIDS, INCLUDING FUEL, ENGINE OIL AND COOLANTS.

CCC (CARGO CARRYING CAPACITY) IS EQUAL TO GVWR MINUS EACH OF THE FOLLOWING: UVW, FULL FRESH (POTABLE) WATER WEIGHT (INCLUDING WATER HEATER), FULL LP-GAS WEIGHT.

CARGO CARRYING CAPACITY (CC GVWR	POUNDS	KILOGRAMS	
MINUS UVW	4		
MINUS FRESH WATER WEIGHT OF	GALLONS @ 8.3 LB/GAL		
MINUS LP-GAS WEIGHT OF	GALLONS @ 4.5 LB/GAL		<u> </u>
= CCC FOR THIS TRAILER*			

\*DEALER INSTALLED EQUIPMENT WILL REDUCE CCC

CONSULT OWNER MANUAL(S) FOR SPECIFIC WEIGHING INSTRUCTIONS AND TOWING GUIDELINES.  $_{
m CD-132}$ 

- Gross Vehicular Weight Rating (GVWR): is the maximum permissible weight
  of this trailer when fully loaded. It includes all weight at the trailer axle (s) and
  tongue or pin.
- Unloaded Vehicle Weight (UVW): is the weight of this trailer as manufactured
  at the factory. It includes all trailer weight at the trailer axle (s) and tongue or
  pin. If applicable, it also includes full generator fluids, including fuel, engine oil,
  and coolants.

- Cargo Carrying Capacity (CCC): is equal to GVWR minus each of the following: UVW, full fresh (potable) water weight (including water heater), and full LP-Gas weight.
- Gross Axle Weight Rating (GAWR): is the value specified as the load carrying capacity of a single axle system, as measured at the tire-ground interfaces.

When loading heavy objects such as tools, skillets, irons, and boxes of canned goods, etc. keep them as low as possible - preferably on the floor. Try to hold additional weight behind the axle to a minimum.

**WARNING:** Never add items such as generators, heavy toolboxes or motorcycle racks to the back of the trailer. Weight behind the axle will tend to magnify any sway that may occur when passing trucks or in gusty wind. If a heavy generator is mounted on the rear bumper what may have been an almost unnoticeable sway turns into a severe sway you may not he able to control.

**CAUTION:** Damage to your trailer caused by mounting heavy objects on the rear is considered abuse, and is not covered by warranty.

B

#### **WEIGHING YOUR TRAILER**

The diagram shows how to weigh the trailer on scales.

3. Weight on Trailer's Toungue

The allowable personal cargo must be distributed in your trailer in such a manner that the Gross Axle Weight Rating is not exceeded.

To determine this it is necessary to load all of your allowable personal cargo and variable weights. Then hitch the trailer to the tow vehicle with load equalizing hitch properly adjusted as shown on the following pages.

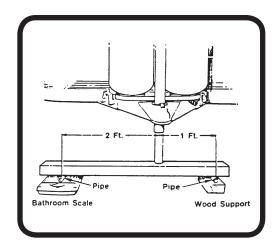

Place the trailer on a scale with both axles only on the scale (see 2). If the weight on the axles exceeds the axle system G.A.W.R. then some of the personal cargo must be redistributed forward in order to place some of this weight on the tongue.

The tongue weight should be in between 10% - 15% of the trailer's total weight, but must not exceed 1,000 lbs. Some tow vehicle manufacturers may restrict the amount of tongue load to a lower value. To determine tongue load, unhitch tow vehicle and place the tongue hitch post on a scale. The trailer must be properly loaded as determined above, with your allowable personal cargo and variable weights.

Use a scale, such as a bathroom scale, that has a lower weight limit than your tongue load to check the tongue weight by using the following method (see illustration).

Place a piece of wood of approximately the same thickness as the bathroom scales on the ground in line with the trailer hitch jack as shown. It should be so spaced that a short piece of pipe or other round piece will lay exactly one foot from the centerline of the jack extension. Place the scales so that another round piece can be exactly two feet from the centerline of the jack extension in the other direction. Place a  $4 \times 4$  on the two round pieces and screw the jack extension down on the top of the  $4 \times 4$  until the tongue of the trailer is supported by it. Multiply the scale reading by three. This will be the tongue weight of your trailer. If you exceed the capacity of the bathroom scales, increase the two-foot dimension to three or four more feet, but always multiply the scale reading by the total number of feet between the wood and scales.

#### **CAUTION:** Be sure trailer is level when you read scales.

#### **HITCHING UP**

Hitching up your trailer is something that will become almost second nature with practice. The following section includes proper hitch load distribution. Proper training on connecting your trailer to a tow vehicle is essential for safety. Please see your dealer or other qualified personnel for instruction on the proper hitching of your trailer.

#### **Equalizing Hitch Load Distribution**

When a trailer is hitched up properly to a tow vehicle with a load equalizing hitch, approximately 1/3 of the trailer's tongue weight will be on the trailer's axles and 2/3 will be transferred to the tow vehicle, 1/3 of this weight transfer will be carried by the front wheels and 1/3 by the rear wheels of the tow vehicle (See diagram), Thus, the tire load of each wheel on the tow vehicle will be increased by 1/6 of the trailer's tongue weight. The tire air pressure of the tow vehicle should be increased to compensate for this additional weight. Refer to the vehicle's owner owner manual for this information.

WARNING: The tongue weight should he approximately 10% to 14% of the trailer's total weight. <u>Under no condition</u> should it exceed the hitch rating. Your hitch installer should provide your hitch rating information to you. Sway Control Device

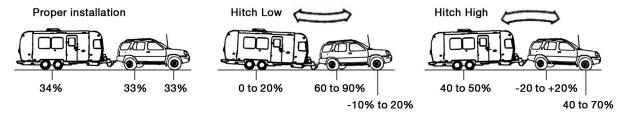

Although Airstream has not intruded into the hitch manufacturers field of expertise and preformed formal testing, we find the vast majority of Airstream owners purchases sway-control devices.

When passed by large trucks or when exposed to sudden crosswinds the trailer will be "pushed" and this action will be felt in the tow vehicle. It's our understanding the sway control devices will reduce the amount of movement and make towing more comfortable and add some safety.

Follow the directions of the sway control manufacturer when having it installed and using it.

<u>CAUTION:</u> Retract the hitch jack completely for maximum ground clearance. Remove and stow the jack pad it in the tow vehicle ®s trunk along with the leveling jack and other gear used when stopped. NEVER TOW YOUR TRAILER WITH THE JACK DOWN. Check that the foldaway step is up and that the main door is completely closed and LOCKED for towing. If it is not locked the constant vibration of travel may cause it to open with possible damage.

### Percentage of Tongue Load distributed to car and or trailer wheels

#### **TOWING TIPS**

We want every owner to be a safe and courteous driver. A few hours of towing practice in a large empty supermarket lot will make pulling your trailer over the road much easier. Line out two corners for left and right turns. You may also use these corners to practice backing and parking.

After thoroughly inspecting your hitch, brakes, and tires you should be ready to tow. Check traffic, signal that you are about to pull away, and start slowly. Look often in your mirrors, and observe the action of the trailer, then carefully move into the proper lane of traffic. Remember that the trailer wheels will not follow the path of the tow vehicle wheels; therefore, WIDER TURNS ARE NECESSARY WHEN TURNING TO THE LEFT OR TO THE RIGHT.

The BRAKE CONTROLLER is activated when you apply the brakes of the tow vehicle. Your tow vehicle brakes will automatically apply the trailer brakes first when properly adjusted. This will help keep your tow vehicle and trailer in a straight line and make you stop as if you were driving the tow vehicle alone. If swaying or swerving should occur, briefly operating the controller separate from the vehicle brakes may help correct the situation. Practice this maneuver on a clear highway or deserted parking lot. Don't wait for an emergency then grope for the controller.

When trailering you might encounter a temporary cooling system overload during severe conditions, such as hot days when pulling on a long grade, when slowing down after higher speed driving, or driving long idle periods in traffic jams. If the hot indicator light comes on, or the temperature gauge indicates overheating and you have your air conditioner turned on, turn it off. Pull over in a safe place and put on your emergency brake. Don't turn off the engine. Increase the engine idle speed. Lift the engine hood and check for fluid leaks at the radiator overflow outlet. Check to see that all drive belts are intact and the radiator fan is turning. If you have a problem have it fixed at the next opportunity. If there is no problem the light should go off or temperature should come down within one minute. Proceed on the highway a little

slower. Ten minutes later resume normal driving.

**WARNING:** Never open a radiator cap when the tow vehicle is hot. Check the coolant level when the vehicle is cool.

When going downhill in dry weather, down shift so that engine compression will slow the whole rig down. Take dips and depressions in the road slowly and do not resume normal driving speeds until you are sure that the trailer wheels are clear of the dip.

**WARNING:** On slippery pavement do not use engine drag to help slow down as this may cause the rear wheels of the tow vehicle to skid. On icy pavement drive slowly and if you feel the tow vehicle skidding gently apply the trailer brakes only. This will bring the tow vehicle and trailer back into a single line. Chains do not help trailer wheels.

When driving in mud and sand let the momentum carry the rig through. Apply power gently and use as little as possible. Stay in the tracks of the vehicle ahead and keep the tow vehicle in the highest possible gear. If you get stuck it is best to tow out the entire rig together without unhitching.

Despite the best hitch you will notice that whenever a large bus or truck overtakes your rig the displaced air first pushes the trailer rear slightly to the right and then affects the front. It may be necessary to steer very slightly, momentarily, toward the bus or truck to help compensate for the sway induced by the passing-vehicle. Do not apply the vehicle brakes, as this can tend to exaggerate the situation. You may find, however, that briefly applying the trailer brakes with your manual control will help eliminate sway.

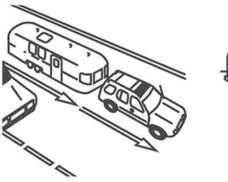

On a two-lane road cars will be lining up behind you because you travel at a lower

speed. It is both courteous and sensible to signal, pull onto the shoulder, and let them pass. Your trailer is designed to be towed easily at any legal speed, so if you are not careful you may be inclined to forget it is there.

#### **Passing**

ON FREEWAYS OR EXPRESSWAYS try to pick the lane you want and stay in it.

Always maintain plenty of space between you and the car ahead, at least the length of the tow vehicle plus trailer for every ten miles per hour. Remember that in order to pass another vehicle you will need longer to accelerate. You must also allow for the length of the trailer when returning to the right hand lane.

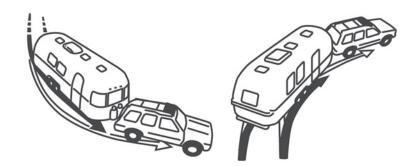

#### **Tracking**

OBSERVE THAT THE TRACKS MADE BY THE TRAILER WHEELS ARE DISTINCTLY DIFFERENT FROM THOSE MADE BY THE TOW VEHICLE. Studying this will make it easier for you to correct mistakes. Truck or trailer type fender or door grip rear view mirrors are a must for maximum visibility and in most states the law requires them.

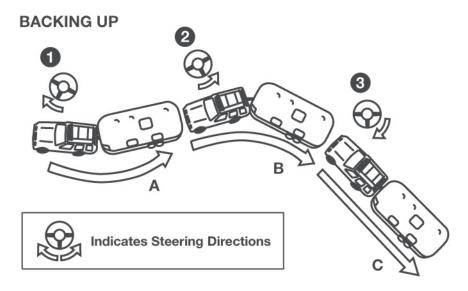

#### **Backing Up**

B

In BACKING UP the important thing to remember is to DO EVERYTHING SLOWLY and to correct immediately if you see the trailer turning the wrong way. Concentrate on the rear of the trailer. With your tow vehicle and trailer in a straight line back up slowly and turn the bottom of the steering wheel in the direction you want the trailer to go. Watch out the window or in the mirror until the rear of the trailer is pointing in the desired direction. Your tow vehicle will be following the trailer in an arc. Straighten the tow vehicle and trailer by turning the steering wheel more sharply, and then when they are in line, straighten the steering wheel.

ALWAYS TRY TO BACK TO YOUR LEFT BECAUSE THE VISIBILITY IS MUCH BETTER. (See Illustration) When you don't make it on the first try it is usually much easier to pull forward to your original position and start over.

If your spouse or traveling companion normally directs you when backing they should position themselves forward of the tow vehicle so the driver can easily see them. Their directions should always indicate to the driver the direction the rear of the trailer should go. A little practice in a parking lot with the person giving directions can save a lot of frustration when backing into a campsite.

Position (A) start. Turn steering wheel as shown in (1) will put you in trailer Position (B). Turning steering wheel show in position (2) puts you in trailer position (C). Steering position (3) returns front wheels for straight backing.

**NOTES** 

#### SUGGESTED PRE-TRAVEL CHECK LIST

Interior		Exterior		Home	
1.	Turn off water pump switch.	1.	Disconnect and slow the electrical hookup	1.	Leave house key with your neighbors.
		1.	·		, , ,

					health and registration papers.	

C

#### **SAFETY**

As always, safety should be one of your top priorities. Make sure you, and everyone traveling with you, can operate the main door and exit window rapidly without light. Contemplate other means of escape in case the designated exits are blocked.

WARNING: The escape windows(s) can be identified by their red release handles. Lifting up both latches, then turning the latches toward the center releases the escape window. Remove the screen. A loop is provided in the SCREEN RETAINING SPLINE so it can be rapidly removed. Push out on the glass and it will swing clear. The window operation should be checked each trip and the latches lubricated with WD-40 or equivalent every six months.

WARNING: At each campsite make sure you have not parked in such a manner as to block the operation of the escape window by being too close to trees, fences or other impediments. Scenic views are one reason for traveling, but don't park so the beautiful lake or steep cliff is just outside your escape window.

WARNING: Read the directions carefully on the fire extinguisher. If there is any doubt on the operation, you and your family should practice, then replace or recharge the extinguisher. You will find your local fire department will be happy to assist you and answer any questions.

Don't smoke in bed.

Keep matches out of reach of small children!

Don't clean with flammable material!

Keep flammable material away from open flame!

We have all heard these warnings many times, but they are still among the leading causes of fires.

Other safety information on the LPG system of your trailer is located in the plumbing section of this manual.

#### **OVERNIGHT STOP-EXTENDED STAY**

Airstream owners have parked virtually every placing imaginable from filling stations to farmlands. In time you'll develop a knack for spying wonderful little roadside locations by turning off the main highway and exploring. There are many modern parks including State, County and Federal parks with good facilities where you might obtain hookups of electrical, water and sewer connections. Directories are published which described in detail these parks and tell what is available in the way of services and hookups.

On overnight or weekend trips chances are you will not use up the capacity of the sewage holding tank, deplete the water supply, or rundown the battery which supplies the 12 volt current.

On a longer trip, when you have stayed where sewer connections and utility hookups were not available, it will be necessary for you to stop from time to time to dispose of the waste in the holding tank and replenish the water supply. Many gas stations (chain and individually owned) have installed sanitary dumping stations for just this purpose. Booklets are available which lists these dumping stations.

When stopping for the night, your Airstream is built to be safely parked in any spot that is relatively level and where the ground his firm. Your facilities are with you. You are self-contained. Unless the tow vehicle is needed for transportation, it is not necessary to unhitch.

All you need to do to enjoy the self-contained luxury of your Airstream is to turn on the LP gas and light any appliances with pilots.

Before moving on, check your campsite both for cleanliness and also to be sure you haven't left anything behind. Turn off the gas supply and make sure everything is properly stowed. Use your PRE-TRAVEL CHECK LIST and you are ready for more travel adventure.

Making a long trip in your Airstream is not very different from making a weekend excursion. Since everything you need is right at hand, you are at home wherever you go. When packing for an extended trip take everything you need, but only what you need.

**WARNING:** Do not parked in a manner that would prevent the escape windows from opening.

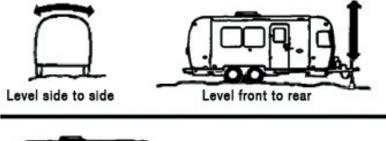

Try to pick as level a parking spot as possible. Stabilizing jacks or blocks probably won't be required for an overnight stay unless you extend a slide out room. However, if you put the jack pad on the hitch jack and run the hitch jack down to take the weight off the cars springs it will provide some stability. If you must parked on a slope, **PARK FACING DOWNHILL**. It is easier to level the trailer this way.

**Note:** Your trailer is not designed, nor intended, for permanent housing. Use of this product for long term or permanent occupancy may lead to premature deterioration of structure, interior finishes, fabrics, carpeting, and drapes. Damage or deterioration due to long-term occupancy may not be considered normal, and may under the terms of the warranty constitute misuse, abuse, or

#### Leveling and Stabilizing

When you plan to stay in the same place for several days, weeks or months, you will want your trailer to be as level and steady as possible. Check the attitude with a small spirit level set on the inside work counter or the trailer hitch "A-Frame". (See Diagram Below) If a correction is necessary then YOU MUST LEVEL FROM SIDE TO SIDE FIRST This can he done easily by backing the trailer up one or more 2" x 6" boards. (See Diagram) We do not recommend placing tires in a hole for leveling.

LEVEL FROM FRONT TO REAR by disconnecting the hitch from the tow vehicle, putting the jack pad under the hitch jack and adjusting the jack up or down until you are level. Block or chock the wheels to keep the trailer from rolling. Use STABILIZING JACKS at all four corners as shown in the diagram to eliminate the natural spring action of the axles.

WARNING: Whenever the trailer must be lifted with a jack, as when changing a tire or leveling on very rough terrain, ALWAYS PLACE THE LIFTING JACK UNDER THE MAIN FRAME RAIL. A label is provided to indicate the proper position for the jack. NEVER USE STABILIZING JACKS TO LIFT THE TRAILER.

#### **HOOK UPS**

HOOK UP TO CITY WATER by attaching a minimum 1/2" high-pressure water hose to the city water service.

The 110-volt shoreline cord is stored in the rear storage compartment. Remove the cord and plug the trailer end into the receptacle on the side of the trailer.

The other end of the shoreline is plugged into City Power Service.

Hook your WATER DRAIN HOSE in the SEWER DISPOSAL FACILITY and attach to the drain outlet in your trailer.

Turn on gas supply. Light the range and oven pilots. Turn on the water heater, refrigerator and furnace.

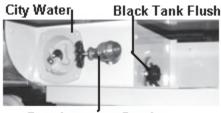

When you stay for an extended period where electric or water hookups are not available, you must make regular checks on the condition of your 12-volt battery.

Hooking up the tow vehicle/trailer electrical connector and running the tow vehicle engine at a fast idle. 45 minutes per day should provide about 3-4 hours of power. Carry drinking water in a clean bucket to refill your tank. When your waste tank nears capacity move to a dumping location.

The exterior CABLE TV and TELEPHONE hookups are located in the power cord storage compartment. The interior telephone jack will be located in the bedroom over the center nightstand in twin bed models and in the hanging wardrobe on the roadside of the bed in the double models.

The TV Antenna Booster must be on to receive antenna signals and off for cable TV operation.

WARNING: Check your escape window(s) to make sure they will open completely. Also make sure the terrain under the window is suitable for rapid exiting.

Exterior water Service

# Exterior Cable TV Hookup

Telephone TV Outlet Hookup W/Booster

#### WINTER TRAVELING

Traveling in sub-freezing temperatures will require certain precautions to protect the plumbing system and your personal belongings from being damaged by freezing.

Whenever possible the heat should be kept on at a constant temperature. It is easier for the furnace to keep a constant room temperature than for the trailer temperature to be allowed to drop to 50 degrees Fahrenheit then attempt to raise it to room temperature.

<u>CAUTION</u>: If you have the optional air conditioners with heat pump they should not be used if ambient temperatures remain below 25 degrees F for more than 12 hours.

Only the furnaces are ducted to provide heat to tanks and plumbing to prevent freezing.

WARNING: Always shut off the LP gas and be sure all flames are extinguished before gasoline is added to the tow vehicle.

Some states do not allow LPG to be turned on while moving. While traveling in these states you must use your common sense. How cold is it? How long will it be before you can turn the heat back on? Is the temperature dropping or raising? Remember, when towing at 50 MPH the wind chill factor will cause the interior of the trailer to cool much faster than a trailer that is parked.

When parked in sub-freezing temperatures make sure you keep a full supply of LP gas and plug into a 110 volt power source whenever possible. A fully charged battery will not last more than 8 to 10 hours if the furnace is running almost constantly and 110-volt power is not available.

Leave cabinet doors, wardrobes and bed doors partially open to allow warm air to circulate around plumbing lines and fixtures. Insulate and/or wrap your exterior water lines with heat tape.

<u>CAUTION</u>: The exterior water service line to the utility compartment is in an unheated section of the trailer and must not be used in below freezing conditions.

A water valve is provided so the water can be turned off to the line. The exterior water service shut off valve is located in the lavatory cabinet. Close the shut off valve and open the water service for a few seconds to drain the line and prevent freeze damage.

#### **EFFECTS OF PROLONGED OCCUPANCY**

Your trailer was designed primarily for recreational use and short-term occupancy. If you expect to occupy the trailer for an extended period, be prepared to deal with condensation and the humid conditions that may be encountered. The relatively small volume and tight compact construction of modern recreation vehicles mean that the normal living activities of even a few occupants will lead to rapid moisture saturation of the

air contained in the trailer and the appearance of visible moisture, especially in cold weather.

#### CONDESATION

Just as moisture collects on the outside of a glass of cold water during humid weather, moisture can condense on the inside surfaces of the trailer during cold weather when relative humidity of the interior air is high. This condition is increased because the insulated walls of a recreation vehicle are much thinner than house walls.

Estimates indicate that a family of four can vaporize up to three gallons of water daily through breathing, cooking, bathing, and washing. Unless the water vapor is carried outside by ventilation, or condensed by a dehumidifier, it will condense on the inside of the windows and walls as moisture, or in cold weather as frost or ice. It may also condense out of sight within the walls or the ceiling where it will manifest itself as warped or stained panels.

Appearance of these conditions may indicate a serious condensation problem. When you recognize the signs of excessive moisture and condensation in the trailer action should be taken to minimize their effects. For tips on controlling condensation see the "Tips To Controlling Condensation" section.

#### TIPS TO CONTROLLING CONDENSATION

To avoid condensation problems, try to follow these tips to help alleviate excess moisture.

- Allow excess moisture to escape to the outside when bathing, washing dishes, hair drying, laundering, and using appliances and nonvented gas burners. Always use the vent hood when cooking.
- Keep the bathroom door closed and the vent or window open when bathing and for a period of time after you have finished.
- Do not hang wet clothes in the trailer to dry.
- In hot weather, start the air conditioner early as it removes excess humidity from the air while lowering the temperature.
- Keep the temperature as reasonably cool during cold weather as possible. The warmer the vehicle, the more cold exterior temperatures and warm interior temperatures will collide on wall surfaces, thus creating condensation.
- Use a fan to keep air circulating inside the vehicle so condensation and mildew cannot form in dead air spaces. Allow air to circulate inside closets and cabinets (leave doors partially open).
   Please keep in mind that a closed cabinet full of stored goods prevents circulation and allows the exterior temperature to cause condensation.
- The natural tendency would be to close the vehicle tightly during cold weather. This will actually compound the problem. Simply put, you need to remove some of the warm air, and

allow some cool outside air to get inside the vehicle, so the furnace will not recycle the humid interior air.

 Use fluorescent ceiling lights and minimize prolonged use of incandescent lights, which produce heat and contribute to condensation in the roof above the ceiling lights.

#### **ABOUT MOLDS**

#### What are molds?

Molds are microscopic organisms that naturally occur in virtually every environment, indoors and out. Outdoors, mold growth is important in the decomposition of plants. Indoors, mold growth is unfavorable. Left unchecked, molds break down natural materials, such as wood products and fabrics. Knowing the potential risks is important for any type of homeowner to protect their investment.

#### What factors contribute to mold growth?

For mold growth to occur, temperatures, indoor or outdoors, must be between 40 degrees and 100 degrees Fahrenheit and also have a source of moisture, such as humidity, standing water, damp materials, etc. Indoors, the most rapid growth occurs with warm and humid conditions.

#### How can mold growth be inhibited?

By controlling relative humidity, the growth of mold and mildew can be inhibited. In warm climates, use of the air conditioner will reduce the relative humidity. Vents are located in the bathing and cooking areas and constant use is advised during food preparation and bathing, even during colder weather. Additionally, opening a window during these activities will assist in ventilation. In extremely humid conditions, the use of a dehumidifier can be helpful.\*

Frequent use of your RV or cleaning regularly is an important preventive measure. Further, any spills should be wiped up quickly and dried as soon as possible. Avoid leaving damp items lying about. On safe surfaces, use mold or mildew killing cleaning products. Check sealants regularly, and reseal when necessary to avoid water leaks. Proper preventive maintenance to the RV and its accessories, as described both in this manual and in accompanying literature, will provide the best protection to the RV.

For more information of controlling moisture in the RV, please read, "Tips to Controlling Condensation," located in this manual.

\*If using a dehumidifier, please read and follow all manufacturer instructions and recommendations to the use and cleaning of the dehumidifier.

Note: Your trailer is not designed, nor intended, for permanent housing. Use of this product for long term or permanent occupancy may lead to premature deterioration of structure, interior finishes, fabrics, carpeting, and drapes. Damage or deterioration due to long-term occupancy may not be considered normal, and may under the terms of the warranty constitute misuse, abuse, or

#### SLIDE OUT ROOM

The trailer should be level prior to extending the slide out room. The front stabilizing jacks MUST be deployed. If the front jacks aren't down when the room is extended the side to side imbalance will twist the body of the trailer if it's only supported by the front hitch jack.

Please read the complete leveling and stabilizing instructions in the Extended Stay part of this section.

Once leveled and stabilized, locate the switches to operate the room. They are black and located on the interior wall just forward of the room. The left switch, marked lock downs, must be used first. The lockdowns are the large paddle latches on each end of the room. Depress the switch to the unlock position and hold. You will see the paddle latch on the forward end of the room retracting. Hold the switch down until the panels are completely retracted and you hear the operating motors just start to strain. The motors are thermal protected so you won't have to worry about damagin them.

Remove the magnetic travel blocks from the travel latches.

Now hold the slide out switch in the out position. Hold the switch until the motor stops indicating the room is fully extended.

Retracting is the same procedures in reverse order.

Make sure the room is retracted and the lockdown

### WARNING! PLEASE READ

LEVEL AND STABILIZE UNIT USING HITCH JACK AND STABILIZER JACKS PRIOR TO OPERATING SLIDE-OUT ROOM. FAILURE TO LEVEL UNIT MAY CAUSE THE ROOM TO OPERATE IMPROPERLY OR CAUSE DAMAGE.

MAKE SURE THERE IS ADEQUATE CLEARANCE TO OUTSIDE OBJECTS BEFORE SLIDE-OUT ROOM IS EXTENDED.

TO PREVENT ACCIDENTAL INJURY, STAND CLEAR OF SLIDE-OUT ROOM WHILE ROOM IS IN MOTION.

REMOVE TRAVEL LOCKS BEFORE ATTEMPTING TO OPEN SLIDE-OUT ROOM.

NEVER ATTEMPT TO MOVE TRAILER WITH ROOM EXTENDED.

INSTALL TRAVEL LOCKS PRIOR TO TRAVEL.

TRAVEL LOCKS TO BE POSITIONED & ADJUSTED PROPERLY TO HOLD ROOM FIRMLY IN POSITION FOR TRAVEL.

paddle latches are firmly engaged PRIOR to storing the stabilizing jacks.

#### **FAILURE TO RETRACT**

In the unlikely event the room won't retract the first place to check is the lock down paddle latches. If curious fingers have hit the lock down switch and the latches aren't fully closed power is automatically cut to the slide out switch. To correct this situation depress the unlock position on the lock down switch until you're sure they are fully retracted then try the slide out room switch again.

Check your 12-volt distribution panel for blown fuses. It is located on the right side of the cabinet under the front window.

The next option is to manually close the room. Under your trailer, where the room is located, there's a large hinged access panel attached to the underside of the trailer. It's rectangular and about a foot wide and six feet long. On the side opposite the hinge three or four stainless steel screws hold the panel closed. Opening the access panel reveals the motor and main drive shaft extending from the motor to the two gear driven slides.

On one end of the motor is a short lever. Swinging the lever up releases a brake that prevents the shaft from turning when the motor is shut off. With the brake released it's now possible to turn the drive shaft with a 3/4-inch wrench. The octagon stub for emergency use of a wrench is located on the end of the drive shaft towards the back of the trailer.

Slide out Mechanism Manufacturer: Power Gear 800-334-4712

### **EXTERIOR**

#### **EXTERIOR**

#### Cleaning

As a general rule of thumb we recommend the trailer be washed about every four weeks and waxed in the spring and fall. In industrial areas cleaning and waxing should be done on a more frequent schedule.

CAUTION: ABRASIVE POLISHES OR CLEANING SOLVENTS SUCH AS AUTOMATIC DISHWASHER DETERGENTS OR ACID ETCH CLEANERS. ARE TOO STRONG AND SHOULD NEVER BE USED. RINSE ALL GRIT FROM SURFACE PRIOR TO WASHING. DO NOT USE WIRE BRUSHES, STEEL WOOL, ABRASIVES OR OTHER SIMILAR CLEANING TOOLS THAT WILL MECHANICALLY ABRADE THE COATING SURFACE. ALWAYS TEST A SMALL INCONSPICUOUS AREA FIRST.

ALWAYS CLEAN YOUR TRAILER IN THE SHADE OR ON A CLOUDY DAY WHEN THE ALUMINUM SKIN IS COOL. Use soft rags or wash mitts always moving lengthwise with the grain of the trailer. NEVER rub hard on the coating. Oil, grease, dust and dirt may be removed by washing with a 5% solution in water of commonly used commercial and industrial detergents. Cleaning should be followed by a thorough clean water rinse. Drying the unit with a chamois or a soft cloth may prevent spots and streaks. WHEN WASHING OR WAXING YOUR TRAILER,

After cleaning and drying, a good grade of nonabrasive automotive paste or liquid wax will increase the life of the finish, especially in coastal areas where the finish is exposed to salt air or in polluted industrial areas. It will also protect the shell from minor scratches and make subsequent cleaning easier.

It is important to remove sap, gum, resin, asphalt, etc. as soon as possible after they appear by washing and waxing. Sunlight and time will bake-harden these materials making them almost impossible to remove without heavy buffing. If a substance

is found on the coating that cannot be removed by normal washing procedures, Airstream recommends using DX 330 Acryli-Clean made by PPG Industries. Follow all directions and warnings on the product container. Acryli-Clean should be used by trained personnel only, using the proper equipment under controlled conditions. Use the Acryli-Clean as sparingly as possible to remove glue, tar, and other similar substance. Rinse with cool water immediately after use.

To keep your trailer looking new, paint the "A' frame, LPG tanks, and rear frame periodically.

The Limited option includes gold plated medallions. Use mild soap and water on a soft cotton cloth to clean. Gold is a soft metal and will scratch, If that doesn't not work, use a mild metal polish such as PEAK METAL POLISH applying lightly with a clean soft cotton cloth.

It is recommended that the caulking and sealant used in external seams and joints such as end shell segments and around window frames, light bezels, beltline and rub rail molding, etc. be checked regularly. If this material has dried out and become cracked or checked, or if a portion has fallen out, it should be replaced with fresh material to prevent possible rain leaks. Caulking and sealing material is available from your Airstream dealer.

Precautions should be taken to prevent excessive sealant from getting on the coated surfaces. Remove excessive sealant before it cures using DX 330 Acryli-Clean made by PPG Industries as explained above.

<u>CAUTION</u>: It may be possible for solvents other than those recommended to extract materials from sealants that could stain the coated surface or could prove harmful to the sealants; therefore, these possible effects must be considered. Test a small area first.

### **EXTERIOR**

#### **Main Door**

**CAUTION:** When towing, the door lock and dead bolt must be secured. If it is not locked, the constant vibration of travel may cause the door to open with possible damage.

#### Screen Door

The screen door secures to the main door by means of a slide bolt type latch. It can be operated independently by releasing the slide bolt and swinging the screen door away from the main door.

#### Step

To operate the step, lift up on the latch bar and the step will drop down.

WARNING: Once the steps are lowered, press down on them to make sure they are secure in their notches.

#### **CAUTION:** Never travel with step lowered or extended

#### **Exterior Windows**

The windows in your trailer are safety glass. To open: release the two lever locks at the bottom, lift up on the two side operator handles until the window is in the desired position, and place the operators into one of the three positioning slots on the side of the frame. To lock the windows reverse this position

**Note:** Some windows are designed as an emergency escape exits. The rubber Spline holding the screen in place is looped so it can be pulled out in one swift motion.

You and all your family should practice escape procedures so they can be rapidly accomplished even in total darkness.

Clean your trailer windows the same way you clean the windows in your home. Clean the seals with a damp cloth or mild detergent every three to six months, taking care not to use strong solvents, as they will damage the seals. A coat of natural silicone lubricant applied after the seal has dried will keep it flexible. Spread the lubricant evenly with a brush or finger, working it into the surface.

This is a good practice for all rubber seals in your trailer. For replacement of a damaged window contact an Airstream Service Center.

Your PLASTIC SCREENS are easy to maintain. Clean occasionally with a damp cloth.

Note: They will melt at the point of contact if touched by a cigarette.

#### **Awnings**

Complete instructions have been provided with your awning. You should make sure your traveling companion is familiar with the operation of the awning. If a sudden wind should come up, or if high wind is forecast, the awning should be retracted and stowed.

#### **CHASSIS**

#### **COUPLER**

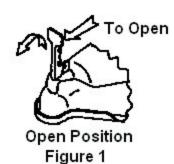

The standard RECOMMENDED HITCH BALL HEIGHT for your Airstream is 18 \_" on all models except the slide outs which are 19.75". If you plan long trips with the trailer heavily loaded you should check your trailer, after loading, to determine the optimum height. To check, park the trailer on a level surface and crank the front jack up or down until the measurement from the frame to the ground is the same front and rear. Measure from the ground to the upper surface of the hitch ball coupler. Add one inch to this figure when setting the ball height on the tow vehicle to allow for the suspension settling under the added weight.

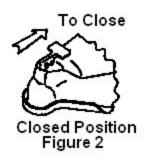

### WARNING: ALWAYS OPEN LATCH HANDLE BEFORE INSERTING BALL

#### **OPERATION INSTRUCTIONS**

- 1. To open slide forward and pull up to open latch before inserting ball.
- 2. Place coupler on ball of same diameter as coupler and of same or greater capacity.
- 3. When ball is completely nested in socket, push top of latch handle rearward until handle snaps into closed position. (Figure 2)
- Extend jack to ground and lift car/trailer combination 2-4" to insure coupler is securely attached to tow ball. Retract jack before towing.
- 5. Insert padlock through hole in handle for theft prevention.

### **EXTERIOR**

#### **POWER JACK**

A switch located on the bottom of the housing operates the power jack. When the jack is fully extended or retracted internal limit switches automatically shut off the motor. Another switch operated the convenience light.

Should an electrical failure occur, remove the power head by loosening the two Allen set screws. The jack post may now be operated manually by inserting the emergency handle into the coupling on top of the post.

#### **Replacing Power Head**

It is essential that the following procedure be used before the power head is replaced on the post.

- 1. With 12 volts connected, ground the power head to trailer "A" frame. Operate main switch in "post retracting direction" until the motor stops automatically.
- Using emergency handle, crank post clockwise by hand until fully retracted, then turn crank one turn counterclockwise.
- Replace head on post and make sure that drive pin is engaged with post coupler.Tighten Allen set screws.

**Note**: Leave tow vehicle transmission in neutral when lifting both units. Dolly wheels are not recommended. Always retract stabilizing jacks before using your Super Jack under load.

#### Maintenance

- 1. Every two years remove screws and cover and check grease condition. Use HMP grease similar to lubricate 630AA and spread on gear teeth, Grease is not required on the nylon timing gears. No internal lubrication of the post is required, but an occasional external application of a silicone or WD-40 spray lubricant on the inner tube of the post when extended is permissible.
- 2. Before replacing the cover ensure that the plate and limit switch unit are located correctly.
- Apply a little sealing compound around the mating surface of the gear cover and replace screws tightening them diagonally. Check synchronization if head has been removed from the post.
- A little penetrating oil on the Allen setscrews occasionally will help prevent corrosion and difficult removal.

### **TIRES**

Your trailer is equipped at the factory with name brand trailer tires. Airstream dealers cannot make adjustments to tires. A dealer who handles that particular brand must do this. If you ever have tire problems check the local telephone directory for the nearest dealer.

To get the maximum performance from your tires check the air pressure often, but only when the tires are cool. Never bleed out air immediately after driving. Recommended tire pressures vary with tire type and size. For pressures refer to the SPECIFICATION TABLE.

# **WARNING: WHEEL SEPARATION CAN OCCUR**

- 1. On first trip, tighten wheel lugs at start and at 10, 25, and 50 miles.
- 2. Thereafter, check whell lugs before each trip.
- 3. Following winter storage, check before beginning a trip.
- 4. Following excessive braking, inspect wheel lugs

Torque aluminum wheels to 110-120 ft. lbs. and steel wheels to 95 ft. lbs.

Try to park out of the sun whenever possible when in warm climates. In desert regions use tire covers to prevent ultra-violet deterioration to tires.

To CHANGE A TIRE with a jack see the label affixed to the underbelly to the rear of the wheels. This label, says JACK with an arrow and points to a plate riveted to the mainframe rail where the jack head must be placed. A flat tire may also be changed without the aid of a jack. Drive the unit up on a ramp 8' wide, 6" high, and about 3 feet long at its base. Position the good tire on the ramp. This will raise the flat tire clear of the ground.

WARNING: Never attempt to change any tire without securely chocking remaining wheels. Never position yourself in a manner where a raised trailer can come down on you if it should become dislodged from a jack or ramp.

All tire and wheel assemblies are balanced at the factory. Be sure to rebalance the tire and wheel assemblies each time a tire is changed.

WARNING: When removing aluminum-forged wheels from spindle, it is very important to mark them to assure the wheel is placed in the same position of the drum when reinstalling. If the aluminum-forged wheel is to be mounted on a different drum it is important to sand all loose corrosion from the mating surfaces.

Be especially cautious in crossing holes or dips in the road. Under these circumstances it is good practice to set your rear view mirrors so that you can observe your tires at all time.

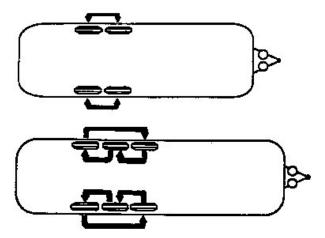

# **TIRE ROTATION**

(10,000-mile intervals)

#### **SPARE TIRE**

The spare tire for Airstreams is stored under the front of the trailer. The front handle of the tire carrier is a one-inch tube protruding out from under the front A-frame on the curbside. It is secured by a bracket and bolt along the inside of the A frame rail. Removing the bolts allows the front on the tire carrier to be lowered and the spare tire removed.

### **AXLE AND RUNNING GEAR ASSEMBLY**

Each Airstream RUBBER TORSION axle is aligned during manufacturing, and doublechecked on a random basis. Alignment after delivery is the customer's responsibility.

Hitting chuck holes or rough railroad tracks while going straight will only cause misalignment after the tire has been struck many repetitive times. Of course, a deep enough hole can affect the alignment immediately.

The worse culprit is a curb because they are normally struck at an angle. Surprisingly rear axles are occasionally damaged when people are attempting to park beside a curb and are backing up their trailer.

As you look under your trailer is it normal for the axle to be bent up in the middle. This bend is how the camber is obtained.

Toe-in is built into the axle by very slight bends in the axle tube on each end.

If tire wear ever indicate misalignment check with your dealer for the nearest location having the proper equipment.

<u>CAUTION</u>: Never allow heat to he applied to the axle tube since the rubber providing the spring torsion action will be severely damaged.

#### **TIRES**

#### Load/Inflation Information for Your Tires

Maintaining proper tire inflation pressure is essential for both tire safety and performance.

### **Proper Tire Inflation**

The level of air in your tires affects your vehicle's overall performance. Not even the highest quality tire will perform well if it's not inflated properly. The correct pressure varies from vehicle to vehicle and depends in part upon driver preference. Each vehicle has a maximum inflation pressure, usually found on a metal tag riveted to the outside of the vehicle as well as on the original equipment tires.

Correct tire inflation is a key component in tire care. The recommended inflation pressures for your tires are indicated on the certification label or in your owner's manual. Since RVs can be loaded with many different configurations, the load on each tire will vary. For this reason, air pressure should be checked based on the load on each individual tire. Cold Inflation Pressure should be adjusted to handle the maximum tire load, and all tires on the axle should carry the same inflation pressure. COLD TIRE INFLATION PRESSURE is the tire pressure checked in the morning before you drive more than a few miles or before rising ambient temperatures or the sun's radiant heat affects it. Check your tires' air pressures at least once a month, before each trip

and each morning you drive during a trip. Tire pressure should be checked cold, as tire pressure ratings have been designed with typical running heat/pressure build-up in mind. Make sure the valves and caps are free of dirt and moisture.

#### Under Inflation

Under inflation brings a higher risk of damage due to road hazards, reduces casing durability, causes a loss in fuel economy, and uneven or irregular tire wear. Severe under inflation brings about an increased risk of tread separation, handling difficulties, and possibly tires failure, caused by overheating.

**IMPORTANT:** Lowering tire pressure in the search for a smoother ride is not only dangerous, it's relatively ineffective, and as the difference in the ride quality is not significant. When minimum inflation pressure requirements are not met, tire durability and optimum operating conditions are compromised. Tire inflation pressure should always meet the guidelines for vehicle weight.

- It may be necessary to inflate your tires at a truck stop or truck service center in order to achieve adequate air pressure for your coach's needs
- Only permanent air seal metal valve caps should be used.
- Be safe if a tire has been run 20% under inflated, it must be dismounted and inspected

by a trained professional. It should not be aired up without a full inspection or without using a safety cage. Use a calibrated gauge. If your tire is rated for higher inflation pressures, a special gauge will be required designed for larger tires.

- Don't bleed air from warm tires to reduce pressure buildup
- Don't inflate tires to cold PSI rating beyond rim specifications

#### **HOW OVERLOADING AFFECTS YOUR TIRES**

Tire pressure is what enables your RV tire to support loads. Overloading your tires can have serious consequences for passengers and your RV. Too much weight can cause stress on your RV's suspension system, brake failure, shock absorber damage, handling and steering problems, irregular tire wear and possible tire failure. Excessive loads or under inflation can lead to an excessive amount of heat and tire failure. If you discover that your tires cannot handle the load, lighten the weight of the load on your tires.

Tire pressure should never be reduced below the vehicle manufacturer's recommended levels to support load conditions in order to improve the ride quality of a vehicle. The difference in ride quality is not significant. When inflation pressure requirements are not met, tire durability and optimum operation can be affected.

# **Recommended Tire Inflation Pressure**

**Recommended Inflation Pressure** is the recommended inflation pressure. The recommended inflation pressure is not to be confused with the <u>maximum</u> inflation pressure that is shown on the side of the tire. At the recommended inflation pressure, tires will last longer and be less likely to fail, and the car will use less fuel. Serious injury can result from tire failure because of under inflation or overloading

Cold Tire inflation Pressure is the tire pressure checked in the morning before you drive more than a few miles or before rising ambient temperatures or the sun's radiant heat affects it. Check your tires' air pressures at least once a month, before each trip and each morning you drive during a trip. Tire pressure should be checked cold, as tire pressure ratings have been designed with typical running heat/pressure build-up in mind. Make sure the valves and caps are free of dirt and moisture.

### **Recommended Cold Tire Inflation Pressure**

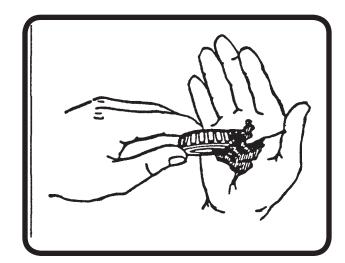

ST 225/75R-15 65 PSI

# **Wheel Bearing Maintenance**

- 1. Jack trailer at marked jack location pad behind axle on mainframe,
- 2. Remove hubcap or spindle cover, wheel and tire.
- 3. Remove cotter pin.
- 4. Remove dust cap.
- 5. Remove spindle nut and washer.
- 6. Remove bearings, hub and rotor.
- 7. Lay down hub and rotor with inside grease seal down. Knock out inner bearing and grease seal using wood or plastic dowel and hammer.
- 8. Clean all parts thoroughly with kerosene.
- Check all bearings and races for chips or roughness of any kind. Any damaged component must be replaced.
- 10. Pack bearing with a good grease (No 2 grade-265 ASTM penetration or equivalent).
- 11. Install inner bearing.
- 12. Install new grease seal in hub or rotor using wooden or rawhide mallet.
- 13. Install hub and drum on spindle.

- 14. Install outer bearing.
- 15. Install washer and spindle nut.
- 16. While rotating the wheel, tighten the spindle nut with a 12" wrench until there is a slight tension. Then back off one notch and install cotter pin. There should now be from .001" to .010" endplay in hub. If not, back off one notch.
- 17. Check the lug nuts at 10, 25 miles and recheck at 50 miles of travel. Aluminum wheels should be tightened to torque of to 110-120 ft. lbs and steel wheels to 95 Ft. Lbs.

When greasing bearings by hand, place a glob of grease in the palm of one hand and push the large end of the bearing down into the grease (see illustration). Keep turning the bearing around and forcing it down through the grease until the grease is extruded up through the opposite end. Wipe the extra grease in your hand around the outside of the bearing. It's not necessary to fill the hub and dust cap with grease.

# WEIGHING YOUR TRAVEL TRAILER OR TOWED VEHICLE

Since a trailer or towed vehicle adds to the load on your RV's tires, it is crucial to properly weigh towed vehicles. A travel trailer should first be weighed with the tongue, while detached from the pulling vehicle. The actual weight of the trailer must be less than or equal to the GVWR for safe operation, otherwise contents must be removed until the weight is within maximum GVWR limitations. The weight of the complete, attached trailer, excluding the towing vehicle, must also be taken. Each wheel should be weighed while still attached to the towing vehicle, and the individual wheel positions on the towing vehicle should be weighed and checked for overload as well.

If you determine that the loading of your vehicle's tires are uneven, the actual weight of the trailer on each tire must be less than or equal to its maximum load capacity for safe operation, otherwise contents must be removed until the weight is within maximum load limitations.

# **TIRE CARE**

Tires are a very precisely engineered product designed for specific applications and use. The tire functions as the sole contact between the vehicle and the road. Therefore, it must provide several different functions in order for your recreational vehicle to handle properly. Most important are traction while moving, grip when steering or stopping, and a comfortable ride for you and your passengers. The Tires on your recreational vehicle are designed for highway use and must be properly maintained in order to maximize tire life, as well to provide a safe mode of transportation. Always keep your tires clean and properly inflated.

Correct tire inflation is a key component in tire care. The recommended inflation pressures for your tires are indicated on the certification label or in your owner's manual. Since RVs can be loaded with many different configurations, the load on each tire will vary. For this reason, air pressure should be checked based on the load on each individual tire. Cold Inflation Pressure should be adjusted to handle the maximum tire load, and all tires on the axle should carry the same inflation pressure. than a few miles or before rising ambient temperatures or the sun's radiant heat affects it.

#### **Tips on Tire Care**

Any tire, no matter how well constructed, may fail in use as a result of punctures, impact damage, improper inflation or other conditions resulting from use. Tire failures may create a risk of property damage or personal injury. To reduce the risk of tire failure we strongly recommend the following:

- 1. Check the pressure in your tires, including your spare, at least monthly when the tires are cool (after the vehicle has stopped three hours and then driven less than one mile.) Do not reduce pressure when tires are hot. Use a tire gauge to check pressure and maintain it at the recommended level.
- Never overload your tires. The maximum load carrying capability of your tires is molded on the sidewall of the tire.
- Check your tires frequently for scrapes, bulges, separations, cuts or snags resulting from use. See your tire dealer immediately if any such condition is discovered.
- 4. Never operate your vehicle in excess of lawful speeds or the maximum speeds justified by driving conditions, or in excess of speeds recommended for the tire you are using.
- Make every effort to avoid running over objects that may damage the tire through impact or cutting, such as chuckholes, glass, metal, etc.
- 6. Never drive on smooth tires. Tires should be removed when 2/32nds inch of tread depth remains. In most states it is illegal to drive with less than 2/32nds inch remaining tread depth.

# The Importance of Proper Air Pressure

The amount of air pressure in a tire determines the load that can be carried safely. Every tire will have the maximum load and inflation molded into the sidewall of the tire. This load and inflation ratio should never be exceeded since this can cause handling problems, irregular wear, and component failure. The proper amount of air pressure is always determined by the weight of your RV fully loaded. This weight takes into account all liquids, supplies, and passengers.

Tire pressure is what enables your RV tire to support loads. Overloading your tires can have serious consequences for passengers and your RV. Too much weight can cause stress on your RV's suspension system, brake failure, shock absorber damage, handling and steering problems, irregular tire wear and possible tire failure. Excessive loads or under inflation can lead to an excessive amount of heat and tire failure. If you discover that your tires cannot handle the load, lighten the weight of the load on your tires.

The level of air in your tires affects your vehicle's overall performance. Not even the highest quality tire will perform well if it's not inflated properly. The correct pressure varies from vehicle to vehicle and depends in part upon driver preference. Each vehicle has a recommended inflation pressure, usually found on a placard on the door section, doorpost, glove door, or fuel door.

#### **Under Inflation**

Under inflation brings a higher risk of susceptibility to damage due to road hazards, reduces casing durability, and causes a loss in fuel economy, plus uneven or irregular tire wear. Severe underinflation brings about an increased risk of tread separation, handling difficulties, and possibly tire failure, which is caused by overheating.

**IMPORTANT**: It's a common practice for RV owners to lower tire pressure in their search for a smoother ride. This is not only dangerous, it's relatively ineffective, and as the difference in ride quality is not significant. When minimum inflation pressure requirements are not met, tire durability and optimum operating conditions are compromised. Tire inflation pressure should always meet at least the minimum guidelines for vehicle weight.

- It may be necessary to inflate your tires at a truck stop or truck service center in order to achieve adequate air pressure for your coach's needs
- Only permanent air seal metal valve caps should be used.
- Be safe if a tire has been run 20% under inflated, it must be dismounted and inspected by a trained professional. It should not be aired up without a full inspection or without using a safety cage. Use a calibrated gauge. If your tire is rated for higher inflation pressures,

a special gauge will be required designed for larger tires.

 Don't bleed air from warm tires to reduce pressure buildup

Don't inflate tires to cold PSI rating beyond rim specifications.

Tire pressure should never be reduced below the vehicle manufacturer's recommended levels to support load conditions in order to improve the ride quality of a vehicle. The difference in ride quality is not significant. When minimum inflation pressure requirements are not met, tire durability and optimum operation can be affected.

Always check air pressure with an accurate air gauge at a cold PSI. Never reduce pressure when a tire is hot and never exceed the maximum cold pressure molded on the sidewall.

Tires on RV applications are subject to a variety of more severe conditions when compared to automobiles or trucks. Because of many chassis and optional equipment differences, it is possible for an RV to be within its Gross Vehicle Weight Rating (GVWR), but overloaded when taking into consideration the weight of each wheel position.

The only way you can know the safe load and inflation pressure for the tires your RV is to know the actual weight of each wheel position under

actual loaded conditions. Under inflation of a tire can cause poor handling, irregular wear, and decreased fuel economy. It also causes extreme heat build up within the components of the tire, which can lead to failure. Over inflation of the tire causes a deformation of the contact patch resulting in crowning of the center tread. This causes handling problems such as reduced traction, irregular wear, and an increased chance for impact damage.

Only after the individual loaded weight is known for each wheel position can a recommended air pressure be utilized using the load and inflation tables included in this web site.

If there is a difference between one side of the RV versus the other, the load must be redistributed so weights are as even as possible. As stated, you can be overloaded by specific wheel position, as well as one side compared to another. Such a situation can cause stresses on tires, wheels, and other components.

Always check air pressure with an accurate air gauge at a cold PSI. Never reduce pressure when a tire is hot and never exceed the maximum cold pressure molded on the sidewall.

The following work sheets are used for determining your loaded weight by wheel position using a conventional platform scale.

How to Determine the Accurate Loaded Weight of Your RV?

Gross Axle, Gross Vehicular, and Gross Combined, weight ratings are located in the chassis owner's manual.

To properly weigh a travel trailer, it should first be weighed, including the tongue weight, while detached from the pulling vehicle. This actual overall weight must be less than or equal to the GVWR for safe operation. If the overall weight is greater than the GVWR, some contents must be removed until maximum GVWR limitations are achieved. Once the actual overall weight is determined and the trailer is within GVWR limits, the following weights must be determined:

- 1. Weight of complete trailer, while attached, but excluding towed vehicle. This will result in the actual weight which is exerted on all of the trailer tires. This weight may be subtracted from the overall trailer weight (above) to determine actual "tongue" weight.
- 2. With the trailer still attached to the towed vehicle, each wheel position should then be weighed separately to be sure each tire is not overloaded. If and overload condition exists on any wheel position, trailer loading must be redistributed or removed. If an overload situation is not corrected, tire or mechanical failures may occur.
- 3. The individual wheel positions (particularly the rear positions) on the towing vehicle should also be weighed for possible overload while the trailer remains attached. This is especially important on 5th-wheel applications where tongue weight may be extreme.

# **Proper Inspection and Storage of Tires**

Before taking your RV on a trip or when removing from an extended storage period, make it a practice to inspect the overall condition of your tires. Check for any type of condition or damage that might result in failure. A thorough check should include both inside and outside sidewalls, tread area and the condition of hardware such as valve stems, valve caps, and wheels. The tread should be checked for any unusual wear, cracking, penetrations and/or cuts. An uneven wear pattern can indicate misalignment or worn suspension parts.

Since many RVs are used seasonally and sometimes stored for extended times, it is possible that tires will take many years to wear out. Tires, as any rubber product, will age over time. If tires show cracking in the sidewall or tread surfaces that are more than 2/32nds deep, they should be replaced before your next trip or vacation. Store your RV in a cool dry area away from major heat sources and extreme cold. An enclosed area is best with no exposure to electromagnetic sources such as generators or transformers. If you must keep your RV outside, cover your tires from direct sunlight. Take your RV to your Tire dealer for service to check or correct any of these conditions.

### **Replacing Your Tires**

It is possible to replace your tires with a different size in some instances to increase your load capacity with a different inflation pressure. If there is a reason to replace your tires with a different size, make sure the following checks are made before the purchase.

- Does the replacement tire have the load capacity that is needed for my RV and will it fit properly inside the wheel well?
- Will the overall diameter difference affect the speedometer or antilock braking system?
- Is the increase in air pressure compatible with the maximum rated pressure stamped on the rim?
- Is there enough dual spacing offset for the rear wheel positions?

Tires used on most RVs are driven at or near maximum loads during hot weather and then are left idle for months. In normal use oils in the tire come to the surface during flexing and protect the rubber from ultraviolet light. But when left idle natural aging may cause the rubber to crack prematurely, especially in the sidewall area.

Any tire on an RV that is over five years old should be inspected by a competent tire professional for cracking and replaced, even if it has no apparent tread wear. This is because a tire on a car or truck might last 80,000 to 120,000 miles before it needs to be replaced, but an RV tire that only travels 5,000 miles per year will not approach that mileage for 20 years. It will need to be replaced much before that.

The first step is choosing a tire adequate for the load. The load rating printed on the sidewall will show the maximum load that can be carried at a defined pressure. As the inflation pressure drops, the load that can be carried is less. As speed increases, the amount of load that can be carried also drops. The load rating is also affected by how the tire is used, as a single or as a dual.

A Goodyear ST225/75 R15 tire inflated to 65 PSI has load capacity of 2540 Lbs.

#### INTERIOR

The interior of all Airstream trailers has been designed for comfort, convenience, durability and appearance. How you use it and how you take care of it naturally depends on you. However, if you learn to operate the interior components and take care of them and the trailer properly, this knowledge will add to your pleasure as well as the long life of your trailer.

All materials should be professionally dry cleaned to remove any overall soiled condition. However, these materials may be spot cleaned using the cleaning code instructions as listed. Sample swatches are furnished to our dealers. The dealer will be able to give you the name of the fabrics used in your particular trailer. Each swatch will show the cleaning code in parenthesis.

#### Upholstery

The following are the cleaning code instructions for the various fabrics used in the Airstream trailers:

#### Code WS

Fabric Care: Spot clean this fabric either with a mild solvent or water based cleaning agent. When using a solvent or dry cleaning product follow instructions carefully and clean only in a well-ventilated room. Avoid any product, which contains highly toxic carbon tetrachloride. You may also use an upholstery shampoo product or the foam from a mild detergent. With either

method pretest a small area before proceeding. Use professional furniture cleaner when an overall soiled condition is reached.

### Code S

Fabric Care: Spot clean, using a mild water free solvent or dry cleaning product. Carefully follow instructions on such product. Clean only in a well-ventilated room. Avoid any product containing carbon tetrachloride, which is highly toxic. Pretest small area before proceeding. Use professional furniture cleaner when an overall soiled condition is reached.

### Code W

Fabric Care: Spot clean, using the foam only from water based cleaning agent such as mild detergent or non-solvent upholstery shampoo product.

Apply foam with a soft brush in a circular motion. Vacuum when dry. Pretest small area before proceeding. Use professional furniture cleaner when an overall soiled condition is reached. The manufacturer of the fabrics designed the above code.

#### Leather

Clean leather fabrics with standard products used for that purpose. Follow instructions on the cleaning products container. <u>CAUTION</u>: Never remove cushion cover for separate dry cleaning or washing. Any tumble cleaning method can destroy the backing, shrink or otherwise damage upholstery fabric.

WARNING: Keep your furniture and family safe from fires caused by careless smoking. Do not smoke when drowsy. Remove immediately any flowing ash or a lighted cigarette, which falls on furniture. Smoldering smoking material can cause upholstered furniture fires.

#### Interior Skin

Most of he interior skin on your trailer is covered with an uphostery that can be cleaned with a vacuumn cleaner. For stubborn spots follow Code W instructions above.

For the vinyl Ceiling covering Damp wiping with mild detergent does routine cleaning. Using any of the automotive cleaners designed for vinyl car seats and dashes can perform more thorough cleaning.

The aluminum interior skin around the galley should be cleaned by follow the same cleaning instructions detailed in the Exterior section of this manual for the exterior skin. Do not use abrasive cleaners or utensils on the aluminum skin as it is coated with a clear coat that could be damaged.

# **Draperies**

<u>CAUTION</u>: All drapery materials and mattress covers must be professionally dry-cleaned.

Unsnapping from the wall, removing a screw or pop rivet from the end of the curtain track, and sliding them out remove draperies. The pop rivets are removed by drilling through the head with a 1/8" drill bit. To prevent damage to the draperies while traveling, the VENETIAN TYPE BLINDS should be lowered, secured at the bottom and the slats turned vertically.

# Carpet

The carpet can be cleaned with any good commercial carpet cleaner, or with a detergent and water. BE CAREFUL NOT TO SOAK THE CARPET WITH WATER.

#### Vinyl Floor

The vinyl floor in your unit can be cleaned with liquid floor cleaning solutions recommended for vinyl floors and warm water.

#### **Counter Area**

The counter areas around the sink are of a highpressure laminate or Corian and can be cleaned with soap and water, or you can use a common solvent on tough spots. Be sure no abrasive cleaner is used, as there is the possibility it could scratch the surface. A protective pad should always be placed under hot utensils. Sanding minor damaged areas can repair Corian counters. The color of the material is constant and not just a surface coat.

# **Vinyl Covering and Interior Ceiling**

Damp wiping with mild detergent does routine cleaning. Using any of the automotive cleaners designed for vinyl car seats and dashes can perform more thorough cleaning.

### **Sinks**

The stainless steel galley sink can be cleaned with a commercial stainless steel cleaner available at most stores. The lavatory sink is a very dense material called KARRAN. In the unlikely event of it ever being stained powdered cleansers such as Ajax/Comet may be used or even Scotch-Brite pads. The color is constant through the thickness of the material,

#### **Shower Stall**

To clean your fiberglass shower stall unit use warm water and one of the stronger liquid detergents. Do not use abrasive cleaners, they may scratch and dull the surface of your fiberglass unit. Stubborn stains can be removed with solvents such as turpentine, paintthinner or acetone. Restore dulled areas by rubbing with an automotive type liquid cleaner then put the soft slow back into your fiberglass unit with a light application of liquid wax.

#### Lounges

To convert the front lounge to a bed first set the armrest cushions out of the way, lift up on the front of the seat and pull it out. This will unhinge the sofa so it can be pushed flat into a bed.

#### **Tables**

Folding tables are lifted into a horizontal position and the legs are folded down to support the table leaf. The leg assembly can be pulled out and the top unfolded to extend the table top.

#### Dinette

The dinette is made into a bed by rising up on the front of the table and folding the table leg up against the bottom of the leaf. As the table is raised it will unhook from the upper wall brackets. Once it is unhooked it can be pulled out and the wall hinge will let it be lowered on the supports of the dinette seats. The backrests of the seats are placed over the table to complete the conversion.

#### **Table**

To open the folding table, lift into a horizontal position and pull the table leg down toward the vertical position until it snaps into place, The leg is hinged at the front edge of the table and is held against the bottom of the table with Velcro. To extend into the double leaf position, lift the table slightly so the leg clears the carpet, and slide the leg and center support out toward the center of the trailer. The leaf then unfolds and rests against the leg support.

Airstream recommends that during travel the table be folded up and stored. It has pressure catches to hold it in place during travel.

#### **Monitor Panel**

The monitor panel allows you to check the amount of fluid in your fresh water tank, black tank (tank #1), and the gray tank (tank #2). The LP bottle gas levels

and battery charge status are also shown. The panel operation is explained in detail later in this manual.

### **Battery Condition Tester**

The battery condition tester, used when not plugged into 110-volt power, will indicate the trailer batteries condition. When they show weak or bad condition you should take every reasonable step to conserve power by using as few lights as possible and switching off appliances. The battery should be charged as soon as practical with the tow vehicle charging system, or by connecting to shoreline 110-volt power.

# **Water Pump Switch**

Fresh water pump switches are located on the monitor panel and in the lavatory. Once the switch is turned on the pump will run until the water pressure reaches about 65 psi. At this point an internal pressure switch will shut it off. When a faucet is opened the water pressure will drop and the pump will start to run again. The water pump switch should be turned off when the trailer is left unattended. Water pressure at some campgrounds may be low. The water pump can be turned on to assist the city water hookup pressure. Be sure there is some water in the fresh water tank. The pump will only use the water that is needed out of the tank to bring the pressure up to the usual standard.

#### **Bathroom Exhaust Fan**

The round bathroom exhaust fan is in the bathroom ceiling and is opened by pushing up on the handle running across the fan opening.

A power lift bathroom fan may be installed in your trailer. The switches for this fan will be located on the forward bath wall. One switch will open the dome for the fan and the other switch will activate the fan.

### **Telephone Shower Head**

The telephone showerhead is designed to give maximum flexibility in usage, and provides for water saving techniques when using your trailer on self-containment. It can be held in the hand and moved about the body. Normally the best water conservation procedure is to wet the entire body and then turn the water off. Apply soap, lather thoroughly, and then rinse the soap off. The telephone showerhead is also used to fill the tub for taking a bath. When you have finished using the shower be sure to shut the water off at the faucet.

## FIREPLACE (Option)

The fireplace is operated by a remote control device supplied wit the unit. Please read the manual supplied with the unit before operating.

#### **Bath Area Remote Switches**

Two remote switches for appliances are located on the bathroom wall. One is for the water pump, and duplicates the pump switch on the monitor panel. Either pump switch may be used to turn the pump on or off at any time.

The second pair of switches, with a red indicator, is for lighting the water heater.

### **Incandescent Light Fixtures**

The light fixture has a switch located on the end of the fixture. Gently squeezing in the middle and pulling down will remove the lens. During cold weather it is a good idea to leave the light on a few minutes prior to removing the lens.

#### Fluorescent Ceiling Lights & Light Bulbs

A wall switch just inside the door control lights in the forward section and a second wall switch in the bedroom will control the bedroom ceiling light. Each light also has its own individual switch. The wall must be turned on for the light switch to work.

Rotating one-quarter turn and bringing the bulb straight out of the fixture will remove fluorescent light bulbs.

#### Fresh Air Vents

A control handle operates the fresh air vents. Turning clockwise will raise the vent and at the maximum extension, vents with fans will automatically turn on. For maximum air without fan, open until fan starts and back up just enough to turn fan off. Turning counterclockwise will close the vent. Screens should be removed for periodic cleaning.

Information on the optional high volume roof vent may be found in the appliance section of this book,

## Storage

The kitchen cabinet should have the heaviest items on the bottom and lighter items overhead. After loading you should have the skillets and can goods on the floor or bottom shelf, and the cereals and crackers in the overhead rooflocker. Use the unbreakable type plates and saucers, and consider storing your dishtowels around them. Better yet, use paper plates. Who wants to wash dishes when on a trip or vacation?

A good place to store heavy items is in the front drawer assembly. It is rated for a 100 lb. capacity, plus adding weight to the front of the trailer may even improve towing slightly.

Clothes hung in wardrobes should be kept on hangers that snap over the clothes rods to keep them from "jumping" off on rough roads. Evening dresses should be kept in the plastic bags like dry cleaning businesses use. No matter how hard you try, if you travel a long dusty section of road the dust will work its way

into the trailer and soil clothes. Try to avoid large bulky coats. Layers of lighter clothing will usually keep you warmer, are more versatile and easier to store.

Some additional storage is available under the shelf in the bottom of the wardrobe, but you must be sure it is loaded so the drain lines, water pump and filter, and heat ducts can't be damaged.

WARNING: Keep flammable material away from the furnace.

Remember, heavy items should be stored low and toward the front, lighter items in the rear and overhead cabinets.

#### CARBON MONOXIDE ALARM

The following information is highlights from the folder provided by the alarm manufacturer. The folder, with more detailed information, is contained in your Owners' Packet.

Test detector immediately following installation and weekly for proper operation by pushing the test button until the YELLOW L.E.D. lights and a short beep is heard (approximately three seconds). Release the button. The detector will then test itself for proper operation. At completion of the self-test, the alarm will sound and both L.E.D.s will light for 3/4 of a second. The detector then resumes normal operation.

#### **NORMAL OPERATION**

In normal operation the detector will flash the RED L.E.D. once every 30 seconds.

#### WARNING CONDITION

If the COSTAR senses a low level of CO The YELLOW L.E.D. will light and the detector will beep every three seconds warning that CO is present. The area should immediately be ventilated. A concentration of 60 PPM within 67 minutes will cause the warning condition. Pushing the test button will silence the warning.

signal but the YELLOW L.E.D. will stay on. After two hours the warning signal will sound again if the CO source has not been eliminated. If the condition persists there is a possibility that it may cause the unit to enter alarm condition (below). If this occurs pushing the reset button will silence the alarm for 30 minutes.

#### **ALARM CONDITION**

If the COSTAR senses unsafe levels of CO, the RED L.E.D. will light up and the alarm will sound. The alarm condition will be signified by a repetitive alarm-sounding pattern of approximately 4.5 seconds on 1.5 second off. Immediate evacuation is required. Pushing the test button will silence the alarm once for approximately 4 minutes.

After approximately 4 minutes the alarm will once again sound until the unsafe CO concentration is removed.

#### **FAULT CONDITION**

Periodically the detector's measurement circuit is tested. If an error is detected, the detector will sound twice and the YELLOW L.E.D. will flash twice every 30 seconds. This is an indication of circuit malfunction and that the detector requires immediate servicing.

#### **MAINTENANCE**

#### **Battery Replacement:**

If tamper resistant pin has been used, refer to "tamper resistant locking pin" for removal instructions.

To replace the battery remove the detector from the mounting plate by rotating the detector in the direction of the "OFF" arrow on the cover.

The Model 9L-1 CO Detector uses one (1) 9-volt battery. The CO DETECTOR is powered by a 9V alkaline battery. A fresh battery should last for one year under normal operating conditions. This detector has a low battery monitor circuit which will cause the detector to "chirp" and the red LED to flash approximately every 30-40 seconds for a minimum of seven (7) days when the battery gets low.

Replace the battery when this condition occurs. USE ONLY THE FOLLOWING 9 VOLT BATTERIES FOR CO DETECTOR REPLACEMENT.

Alkaline type: EVEREADY522; DURACELL MN1604; GOLD PEAK 1604A

Lithium type: ULTRALIFE U9VL

NOTE: REGULAR TESTING IS RECOMMENDED.

WARNING: USE ONLY THE BATTERIES SPECIFIED. USE OF DIFFERENT

BATTERIES MAY HAVE A DETRIMENTAL EFFECT ON THE CO DETECTOR.

### **CLEANING YOUR DETECTOR:**

To clean your detector remove it from the mounting bracket as outlined in the beginning of this section.

You can clean the interior of your detector by using your vacuum cleaner hose and vacuuming through the openings around the perimeter of the detector. The outside can be wiped with a damp cloth.

AFTER CLEANING, REINSTALL YOUR DETECTOR. TEST YOUR DETECTOR BY USING THE TEST BUTTON.

Test detector weekly for proper operation by pushing the test button until the YELLOW L.E.D. lights and a short beep is heard (approximately three seconds). Release the button. The detector will then test itself for proper operation. At completion of the self-test, the alarm will sound and both L.E.D.s will light for 3/4 of a second. The detector then resumes normal operation.

### **SERVICE AND WARRANTY**

If after reviewing this manual you feel that your CO Detector is defective in any way, do not tamper with the unit. Return it for servicing to: Quantum Group, Inc., 11211 Sorrento Valley Road, Suite Valley Road, Suite V. San Diego, CA 92121.

Or call us toll free (800) 432-5599

E-mail address: mktsls@gginc.com

#### **SMOKE DETECTOR**

A smoke detector is provided with your trailer. A manual pertaining to the detector is included in the paper work given to you at the dealership. Please read and follow all care, maintenance, and safety information contained in this manual.

The smoke alarm will "beep" once a minute for at least 30 days when the battery is weak. The battery must immediately be replaced with a fresh one.

#### LP GAS DETECTOR

In the kitchen area of your unit, approximately six inches above the floor, is the LP gas detector. LP gas is a mixture of gases produced and sold commercially as a fuel for heating and cooking appliances. LP gas is highly flammable and, as a result, can be explosive if ignited under certain circumstances. LP gas is heavier than air and, if confined in a closed space, will accumulate close to the floor. When the LP gas concentration in your unit exceeds 2000 PPM the detector will provide a visual and audible alarm by sounding a buzzer and flashing the red LED two times per second.

WARNING: Activation of this detector indicates the presence of LP gas, which can cause an explosion and/or fire. This normally indicates a leak in the LP gas installation or a LP gas appliance. Extinguish all open flames, open your windows and door and evacuate the unit immediately. Do not activate any electrical switch. Turn off the LP at your gas bottle(s). DO NOT RE-ENTER YOUR UNIT UNTIL A QUALIFIED REPAIR TECHNICIAN HAS CORRECTED THE PROBLEM.

#### **OPERATION**

Your LP gas detector is wired directly to your vehicle battery and incorporates a 1-amp in-line fuse. When the device is operating normally the green LED will be lit.

WARNING: It is not recommended that the detector be disconnected from

the battery during periods of storage. There is a small heater on the sensor of the device, which "burns" away impurities in the air during periods of normal use. During periods when power is interrupted, impurities can build up on the sensor. When power is returned to the detector the detector alarm may activate until the impurities are "burned" off. This could take a number of hours, during which time the alarm will be constantly "on".

### **DETECTOR TEST**

Press the test button for 5 to 6 seconds until the alarm sounds then release the test button. The red LED should flash and the alarm sound for approximately 4 minutes. This test should be performed at least once a week during normal vehicle operation, and after periods of storage, and before each trip.

WARNING: Have a professional check your system if you have any doubts.

### **FIRE EXTINGUISHER**

The fire extinguisher just inside your forward door should have the charge checked on a regular basis. Make sure your family, especially the cook, knows how to release the extinguisher storage bracket, and how to properly operate the extinguisher. If you find the directions on the extinguisher unclear, check with your local fire department for professional advice on its operation and use. We're sure they will be happy to assist you and your family.

#### **EXTERIOR WINDOWS AND SCREENS**

The windows in your trailer are safety glass. To open: release the two lever locks at the bottom, lift up on the two side operator handles until the window is in the desired position, and place the operators into one of three positioning slots on the side of the frames. To lock the windows, reverse this procedure.

Note: Some windows are designed as emergency escape exits. The rubber spline holding the screen in place is looped so it can be pulled out in one swift motion.

You and all your family should practice escape procedures so they can be rapidly accomplished even in total darkness.

WARNING: Never park your trailer so the escape windows cannot be easily used for emergency exits.

These windows are cleaned in the same manner that ordinary windows are. Clean the seals with a damp cloth or mild detergent every three to six months, taking care not to use a strong solvent, as it will damage the seals. A coat of natural silicone lubricant applied after the seal has dried will keep it flexible. Spread the lubricant evenly with a brush or finger, working it into the surface. This is a good practice for all rubber seals in your Airstream. For replacement of a damaged window contact an Airstream Service Center or the factory.

### **SCREENS**

Your plastic screens are easy to maintain. Just clean them occasionally with a damp cloth.

**Note**: Window and door sceens will melt at the point of contact if touched by a cigarette.

#### PLUMBING SYSTEMS

### LIQUID PETROLEUM GAS (LPG)

#### FILL VALVE

Your trailer is equipped with LP tank fill valves called "RV Type I Acme" connection. The large, green, nylon swivel nut is a right hand thread and is designed for hand operation only.

The valve features an internal spring-loaded module that will not allow gas to flow from the cylinder until a positive seal has been made at the connection. The valve outlet has 1-5/16" Acme threads on the outlet exterior and female POL, left-handed threads on its interior. This feature allows for connection of the new wrenchless, right-handed, Acme RV connection and still accommodates the standard left-handed POL fittings used for filling propane cylinders.

The mating, green swivel nut and brass nipple also incorporates new features: the green nylon nut swivels on a black bushing that is heat sensitive. Between 240 degrees F and 300 degrees F the bushing will yield (melt) allowing the spring-loaded module in the valve to push the brass nipple back (approximately 1/4") closing the module and stopping the flow of gas from the cylinder. Inside the brass nipple is a flow-limiting device designed to sense excessive gas flow. If an excessive flow is sensed, the flow-limiting device shuts the flow down to a maximum of 10 SCFH (Standard

Cubic Feet per Hour) or less. This is also referred to as the by-pass flow.

By-pass flow is extremely important in the proper operation of this connection. The flow-limiting device may activate if the cylinder valve is opened quickly. When all appliances are off, the by-pass flow allows the pressure downstream from the flow-limiting device to equalize. When pressure is equalized, the flowlimiting device will supply normal flow to the system. Equalization occurs in approximately 5 seconds and in most cases goes completely unnoticed. If, however, an appliance is left on or there is a leak or open flow in the system, the by-pass pressure will not be able to equalize and allow the flow-limiting device to re-open. Symptoms of this condition would be appliances that light but have lower than normal flame or starve out from lack of gas, a substantial reduction in the flame when another appliance is operating, or pilots that are difficult to light. If this should happen, the following steps should eliminate the condition:

- 1. Close LP cylinder valve.
- 2. Extinguish all flames and smoking materials
- Be sure all gas appliances, including their pilot lights, are off.
- Open LP cylinder valve slowly. DO NOT SNAP OPEN.

- 5. Wait at least 15 seconds before lighting appliances.
- 6. If operational difficulties continue, there may be a leak in the system. Immediately close the LP cylinder valve and have the system inspected by a qualified RV service technician.

Again, make sure all appliances are off before opening propane cylinder valves.

Exception: when reconnecting a full cylinder to an auto changeover regulator it is not necessary to shut off the appliances or close the valve of the cylinder already in service.

WARNING: LEAKING LP GAS MAY IGNITE CAUSING A FIRE OR EXPLOSION WHICH COULD RESULT IN SERIOUS BODILY INJURY, PROPERTY DAMAGE, OR DEATH.

How long a full tank of gas will last is dependent on usage. In cold weather, when you are using the furnace, large amounts of hot water, and are doing extensive cooking, you will naturally use more than you will in warm weather when you may do limited cooking. On the average, with normal cooking and other appliance use you can probably count on two to three weeks of service from each tank.

#### **AUTOMATIC GAS REGULATOR**

All models are equipped with a two stage automatic change over gas regulator that offers the convenience of automatic changeover from empty to full gas cylinders. Both tanks are connected to this regulator.

Make sure there is propane in both tanks before you start. Rotate the black lever on the top front side of the regulator toward the cylinder you want to use first. This will be the "service" cylinder and the other will be the "Reserve" cylinder. Slowly open both cylinders valves. Open both cylinder valves completely, then close about 1/4 turn. This will allow you to easily check to see if valves are open or closed. The indicator on top of the regulator will turn bright green. The indicator will stay bright green as long as there is fuel coming from the service cylinder. When the service cylinder empties, the regulator will draw fuel automatically from the reserve cylinder providing an uninterrupted fuel flow to the system. When it switches over, the indicator will change from green to red. This red color indicates the service cylinder is empty and needs to be filled.

WARNING: LP gas regulators must always be installed with the diaphragm vent facing downward. Regulators that are not in compartments have been equipped with a protective cover. Make sure that regulator vent faces downward and that cover is kept in place to minimize vent blockage, which could result in excessive gas pressure causing fire or explosion.

**CAUTION:** The LPG bottles are securely mounted on the front "A" frame of your trailer. If these bottles must be removed for service or replacement it is important that they be reinstalled correctly in order to prevent any possibility of their falling off or becoming dislodged during travel.

#### LPG BOTTLES

The following step-by-step procedure gives you the proper method of removing and installing these bottles:

- Turn the knob on your automatic regulator so the arrow points to the tank opposite the one to be removed. Shut off the gas valve on the bottle to be removed.
- Disconnect the rubber gas line at the bottle to be removed. (This fitting has a left hand thread and turns in the opposite direction to most threaded fittings.)
- 3. Turn the large clamping "T" handle counterclockwise until the hold down bracket is loose enough to remove the bottle. If your trailer is equipped with a gas bottle cover the "T" handle must be removed, and then remove the cover before removing the bottle.

#### To Install

- 1. Place the bottle in position on the "A" frame and bottle cross member so that it rests on the upper collar of both bottles with the collar rims engaged in the grooves on the underside of the bracket. If your trailer is equipped with a gas bottle cover it should be positioned over the bottles next. Make sure the hold down rod projects up through the hole in the shroud center bracket.
- 2. Replace the "T" handle and tighten down until the bottles are held firmly in place.
- Turn on gas shut off valves and test all fittings with a soap suds or detergent solution and watch for bubbles.

If you have allowed both tanks to run out, air may have gotten into the lines. In this event, the air must be forced out through the lines by gas pressure before you will be able to light the pilots. Hold a match to the pilot of the appliance closest to the tanks until it lights and stays lit. Then move to the next closest, etc.

Twice a year, or after a long storage period, we suggest you take your unit in for a checkup and cleaning of the gas operated appliances. Е

#### **BASIC RULES FOR SAETY**

Many things can be construed as safety related, but the most important is your common sense. If you are careless with matches, cigarettes, flammable material or any other hazardous material, we are sure you realize your potential for accidents is greatly increased.

WARNING: Your LP tanks must be filled as directed by the tank manufacturer. Instructions are located on a decal near the fill valve. The decal must not be defaced.

WARNING: Your LP tank must be, and can only be, placed in the proper position when remounting on the front of the trailer. In any other position the base of the tank will not fit into the recess.

WARNING: Use only the gas bottles furnished with your trailer. If replacement is required it must be a bottle of the same size and design.

WARNING: The vent at the bottom of the regulator must be kept free of any obstructions and must be pointed downward. A good habit is to check the vent each time a bottle is removed for filling. It is especially important to check the vent if the trailer has not been used regularly.

WARNING: Do not store LP containers within a vehicle. LP containers are equipped with safety devices that vent gas should the pressure become excessive.

WARNING: Do not use cooking appliances for comfort heating. Cooking appliances need fresh air for safe operation. Before operation open an overhead vent or turn on an exhaust fan and open a window.

A warning label has been located in the cooking area to remind you to provide an adequate supply of fresh air for combustion. Unlike homes, the amount of oxygen supply is limited due to the size of the recreational vehicle; and, proper ventilation when using the cooking appliances will avoid dangers of asphyxiation. It is especially important that cooking appliances not be used for comfort heating as the danger of asphyxiation is greater when the appliance is used for long periods of time.

WARNING: Portable fuel burning equipment, including wood and charcoal grills and stoves, shall not be used inside the recreational vehicle. The use of this equipment inside the recreational vehicle may cause fires or asphyxiation.

WARNING: A warning label has been located near the LP gas container. This label reads: DO NOT FILL CONTAINER (S) TO MORE THAN 80 PERCENT OF CAPACITY.

Overfilling the LP gas container can result in uncontrolled gas flow, which can cause fire or explosion. A properly filled container will contain approximately 80 percent of its volume as liquid LP gas. Use only certified refill LP stations when filing an LP bottle

WARNING: Do not bring or store LP gas containers, gasoline or other flammable liquids inside the vehicle because a fire or explosion may result.

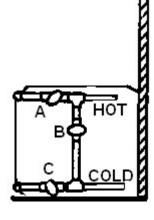

- Extinguish any open flames, pilot lights and all smoking materials.
- 2. Do not touch electrical switches.
- Shut off the gas supply at the tank valve(s) or gas supply connection.
- 4. Open doors and other ventilating openings.
- 5. Leave the area until odor clears.
- Have the gas system checked and leakage source corrected before using again.

#### WATER SYSTEM-SELF CONTAINED

Fill the water tank by opening the exterior access door and remove screw cap. A garden hose can now be inserted. It's a good idea to let the water run through the hose for a short time to flush it out. Experienced RVers usually fill their tanks with "home" water to avoid strange water that may be distasteful to them.

The amount of water in the tank may be checked on the Monitor Panel, or you may fill the tank until water overflows out of the fill.

To set valves to normal position for useing the heater, shut off valve B - open valves A and C. In some models the valves may be in a horizontal pattern rather than the vertical shown in the illustration. Valve operating sequence will be the same. Access to the valves in most units is through the lavatory cabinet door; on others it will be necessary to remove a lavatory cabinet drawer.

Open the hot side of the galley or lavatory faucet and turn on the water pump switch located on the monitor panel. For some time the open faucet will only sputter. This is because the water heater is being filled and air is being pushed out through the lines. Once the water heater is full a steady stream of water will come from the faucet. Now open a cold faucet. It will sputter for a short time, but will soon expel a steady stream.

All other faucets can now be opened until all air is expelled.

Once the system is filled with water and the faucets closed, the water pump will shut off. When a faucet is opened the pump will come back on automatically. If the faucet is just barely open it is normal for the pump to cycle on and off rapidly.

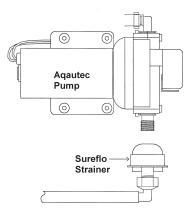

Water pressure at some campgrounds may be low on city water. The water pump can be turned on to assist the city water hookup pressure. Be sure there is some water in the fresh water tank. The pump will only use the water that is needed out of the tank to bring the pressure up to the usual standard.

Reverse valves to bypass water heater for winterizing.

### WATER PUMP AND STRAINER

The water pump and strainer are located in the curbside wardrobe on all models.

To clean strainer screen, first remove inlet connection from the pump side of strainer. This will allow the intake side of the strainer to be rotated about 1/8 turn counter clockwise and be removed. The screen part of the strainer will now be accessible for cleaning.

When reassembling only rotate the inlet side of the strainer until the stops are felt. The "O" ring performs sealing and too much pressure will only break the strainer.

F

### **SANITIZING**

Potable water systems require periodic maintenance to deliver a consistent flow of fresh water. Depending on use and the environment the system is subject to, sanitizing is recommended prior to storing and before using the water system after a period of storage. Systems with new components, or ones that have been subjected to contamination, should also be disinfected as follows:

- Use one of the following methods to determine the amount of common household bleach needed to sanitize the tank.
  - A) Multiply "gallons of tank capacity" by 0.13; the result is the ounces of bleach needed to sanitize the tank.
  - B) Multiply "Liters of tank capacity" by 1.0; the result is the milliliters of bleach needed to sanitize the tank.
- 2. Mix into solution the proper amount of bleach within a container of water.
- 3. Pour the solution (water/bleach) into the tank and fill the tank with potable water.
- 4. Open all faucets (Hot & Cold) allowing the water to run until the distinct odor of chlorine is detected.
- 5. The standard solution must have four (4) hours of contact time to disinfect completely. If you double the solution, this concentration allows for contact time of one (1) hour.
- 6. When the contact time is completed, drain the tank. Refill with potable water and purge the plumbing of all sanitizing solution.

**NOTE**: The sanitizing procedure outlined above is in conformance with the approved procedures of RVIA ANSI Al19.2 and the U.S. Public Health Service.

**NOTE**: A petcock, visible between the tires, will drain the tank sufficiently for most purposes. Total drainage may be achieved by removing the large Allen Head Plug located on the bottom of the tank. An access plate must be removed to expose the plug.

#### **CITY WATER HOOK-UP**

The city water hook-up is found on the lower roadside of the trailer in the utility compartment. A short piece of hose has been provided to extend the city water hookup.

Use a high-pressure hose of at least 1/2" diameter. It should be one that is tasteless, odorless and non-toxic designed for RV use. The city water inlet is a standard garden hose thread. We suggest you carry two lengths of hose. This way you have the ability to reach hookups further away than normal, plus you have a spare hose should one fail or become damaged unexpectedly.

After hooking up the hose and turning on the city water valve provided in the park, slowly open a faucet. There will be a lot of spurts and sputtering until all the air is expelled from the trailer system. If the water heater is empty it will take some time before all the air is expelled and you get a steady flow of water at the faucet. Once a steady flow is achieved at one faucet the others should be opened long enough to expel the air in the lines going to them.

Water pressure at some campgrounds may be low. The water pump can be turned on to assist the city water hookup pressure. Be sure there is some water in the fresh water tank. The pump will only use the water that is needed out of the tank to bring the pressure up to the usual standard.

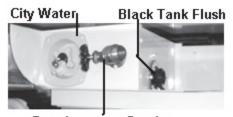

Your plumbing system has a built in pressure regulator to protect your lines and faucets from extremely high pressures on some city water systems.

### **EXTERIOR WATER SERVICE**

Also in the utility compartment is a hose connection with a shut-off valve. This is plumbed into the high-pressure water system of the trailer. This is an ideal place to rinse the sand off your feet after going to the beach, cleaning mud off your boots and hundreds of other messy jobs that are better done outside of your trailer. During freezing weather this line should be drained. Shut off the valve inside the lavatory and leave the exterior valve open.

**NOTE**: On some units only the exterior water service shut off valve will be located inside the lavatory cabinet. On others there may be up to five valves located inside the cabinet. Three of these are used as the water heater by-pass system as described in the winterizing section. Another may be for the toilet shut off. The fifth valve is for the exterior water service. Always check to see if the water supply has been cut to the exterior service before using the rest of the water system in freezing weather.

Exterior water Service

### **GALLEY FAUCET**

Your Moen faucet integrates carbon block filtration technology designed by Culligan International into a faucet spout. This technology is fast and effective at reducing contaminants commonly found in water and is certified by NSF® International.

A Moen faucet manual pertaining to your faucet is placed with your paper work. This manual contains valuable information on the care and operation of your faucet. If you have further questions, Moen provides the toll free number below for your convenience.

1-877-DRINK-H20

Monday through Friday 8:00 a.m. to 8:00 P.M.

1-877-374-6542

Saturday 8:00 a.m. to 6:30 p.m.

#### **CARE AND MAINTENANCE**

All that is needed to clean your faucet is a soft damp cloth. Moen does not recommend the use of scour pads, cleansers or chemicals. The abrasive nature of these substances could damage the faucet's finish. A non-abrasive car wax will help to protect the finish. DO NOT SUBMERGE OR PLACE FAUCET HEAD IN DISHWASHER. DO NOT PLACE WAND APPLIANCE IN A DISHWASHER.

#### FILTER REPLACEMENT

MicroTech™ replacement filter cartridges may be purchased from the dealer nearest you, call 1-800-BUY-MOEN. Use only MicroTech filter cartridges with the PureTouch® Filtering Faucet System.

#### LAVATORY FAUCET

#### Care Instructions for the Non-Tarnish Finish

As with any fine polished surface, your faucet will retain its shine for years to come with proper care. The LifeShine TM finish on this faucet does not require the extraordinary work needed to maintain most fine polished brass finishes.

Be sure to read and follow usage instructions enclosed with any scour pad or scrub sponge before use.

- <u>Caution</u>: Do not use pads or sponges that specifically do not recommend use for cleaning polished surfaces.
- <u>Caution</u>: Many pads or sponges with green fibrous surface (such as Scotch-Brite TM heavy duty scrub sponges) contain microscopic mineral particles that can scratch nearly all polished surfaces, including this faucet finish.

The LifeShine TM finish can be cleaned with most household cleaners (including mild abrasives), when used according to their manufacturers instructions for use.

 Rinse any strong cleaners off immediately after use to maintain the LifeShine TM finish luster.
 Mild scrubbing with fine steel wool (0000 grade) can remove built up dirt or water stains.

Visible water spots on this highly lustrous and reflective finish can be easily wiped off with a cloth dampened with water or with glass cleaner.

In the US call Moen's toll free Help line number, 1-800-Buy-Moen (289-6636) for anwsers to any product, warranty, or installation questions.

In Canada call 1-800-465-6130, Toronto: 905- 829-3400.

### MOEN SHOWER MIXING VALVE ASSEMBLY

### SHOWER MIXING VALVE CARTRIDGE REMOVAL

Shut off water pressure for entire system.

Disassemble: Remove handle cover. Take out handle screw and remove handle and stop tube, Lift out retaining clip and pull the cartridge out of the body by the stem.

<u>CAUTION</u>: Reinsert cartridge by pushing it all the way into the body and until the front of the ears on the cartridge shell are flush and aligned with the body. Replace the retainer clip so that the legs straddle the cartridge ears and slide down into the bottom slot in the body. This prevents the cartridge from rotating and locks it in the body. Reinstall stop tube and handle. Tighten handle screw securely, and replace the handle cover. The red flat on the stem must point UP when mounting the knob handle (down for lever handle).

If cold water is on left side and hot water is on right side (red flat pointed down), remove cartridge and reinstall 180 degrees.

#### **DRAIN VALVES**

The line drain valves have been moved to the exterior of the coach for easier access. If you look between your tires you can see a galvanized "box" that is a few inches lower than the trailer frame. This "box" or pan supports the water tank.

The line drains will be the two brass petcocks extending from the end of the pan. The white plastic petcock you will see is to drain the water tank.

# To Empty Fresh Water Tank

Pumping the water out with the self-contained water pump may empty the fresh water tank. Simply turn on the pump switch and open a couple of faucets until the water will no longer comes out. On all models there is also a petcock type drain valve located in the wheel well and extended out through the tank support pan.

An additional drain plug is located on the bottom of the tank, accessible under the inspection plate close to the petcock that can be seen on the bottom of the tank support pan.

**Note**: For winterizing purposes, only the petcock behind the tires needs to be opened to drain the tank.

#### Water Heater Draining

All models have a drain plug or petcock on the water heater. Access is from the exterior. The plug or valve is usually located in the lower left corner, viewed as you face the exterior of the water heater.

# **WATER VALVES**

Your Airstream has five in-line water shut off valves. Two are for shutting off the cold water supply to the toilet and exterior water service and the other three are for bypassing the water heater when winterizing using the anti-freeze method as explained in the winterizing section of this manual.

The water heater by-pass valves.may be located in one of two places. Inside the lavatory cabinet, accessed by opening the cabinet door or removing the cabinet drawer, or by opening the roadside exterior compartment door.

The toilet shut off valve is used to shut water off to the toilet in an emergency or service situation. On some units it is located inside the lavatory cabinet, on most units it is located just behind the toilet close to the floor.

The exterior water service shut off valve is located on the cold water supply line running inside the lavatory cabinet and can be accessed by either opening the cabinet doors or removing the cabinet drawers. Since the exterior water service is located beyond the heated area of the trailer, the exterior valve and its supply line can be damaged if the water is not turned off in freezing temperatures. In these temperatures shut off the valve in the lavatory cabinet and open the exterior water service. This drains the water in the so freezing won't damage the exterior valve.

There may be one, two, or five valves located inside the lavatory cabinet according to your model length. If there are more than one, three of valves are used as the water heater by-pass system as explained above and are easily recognizable as they will be located next to the water heater. Another may be for the toilet shut off. The fifth valve is for the exterior water service. Always check to see if the water supply has been cut to the exterior service before using the rest of the water system in freezing weather.

#### WINTERIZING AND STORAGE

When storing your trailer for short or long periods use the same precautions as you would in your own home in regard to perishables, ventilation and rain protection. In addition, for prolonged storage periods flush out all the drain lines and the holding tanks. Also drain the entire water system including the water heater and the water storage tank. Instructions for draining the water system are explained in the following paragraphs on winterizing.

THE MAIN CONSIDERATION IN WINTERIZING IS TO GUARD AGAINST FREEZING DAMAGE TO THE HOT AND COLD WATER SYSTEMS, THE WASTE DRAIN SYSTEM (INCLUDING THE TRAPS), AND THE WATER HOLDING TANKS, AND THE WATER HEATER AND THE BATTERY.

To completely winterize your trailer follow this procedure.

- 1. Level the trailer from side to side and front to rear. Open all faucets
- Turn the water pump switch to the ON position to expel water from the storage tank
- Open all drain valves including drain plug or valve on water heater and exterior water service valve. (See drain valves on previous page)
- 4. While the water is draining from the system, open and flush the toilet-flushing valve. Depress hand spray lever while holding the spray head down inside the bowl. Depress hand spray thumb button on the telephone showerhead while holding down inside the tub and drain all water from the flexible hose. Unscrew the heads on both spray units and store.

- 5. Turn the pump switch OFF after all water has been removed from the storage tank.
- 6. Remove exhaust hose from water pump.
- 7. Disconnect the water pump inlet connection and turn the pump on until all the water is expelled. This water, about 1/2 cup, can be caught in a towel or rag.
- 8. Lower the front of the trailer as far as the jack will allow until water ceases to drain, then crank the jack up as high as it will go and let any remaining water drain out.
- 9. After the water has stopped running from the drain lines, apply at least 60 lbs, of air pressure at the city water inlet. An air to city water adapter is available from your dealer's RV accessory store. Be sure the toilet valve and all drain valves and faucets are open and pump outlet hose is disconnected. This can be accomplished at a service station and will force any remaining water from the water heater and remove any water which may be trapped in low areas.
- 10. Pour a cup of \*approved non-toxic RV antifreeze into the lavatory, sink and tub drains to prevent trap freeze-up.

\*Approved and listed by a recognized testing authority such as UL (Underwriter Lab).

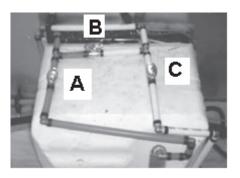

11. Be sure to open the waste holding tank drain valves and drain and flush the tanks thoroughly (THIS IS VERY IMPORTANT AS THE SEWAGE IN THE TANKS, IF FROZEN, COULD SERIOUSLY DAMAGE THE TANKS.) F

- 12. Remove the cartridge of the water purifier and leave the purifier valve in the open position. (If so equipped.)
- 13. Remove the batteries from your trailer and store in a cool dry place where there is no danger of freezing. It is very important for optimum life of a battery to check it periodically and to keep it fully charged.
- 14. Remove any items (food, cosmetics, etc.) from trailer interior that might be damaged by freezing - or might damage the trailer if containers break.

For additional winterizing protection add a non-toxic antifreeze (approved for drinking water system) to the water lines using the following procedure.

- 1.Reconnect all lines except the hose to the pump inlet port. Close all drain valves.
- 2\* Turn by-pass valve to by-pass position. Access to the by-pass valves is in the lavatory cabinet. If your trailer has rear twin beds valve access may be through the exterior storage door just to the rear of the water heater.
- Attach a length of hose to the pump inlet port. This piece of hose should be long enough for the free end to be inserted into and reach the bottom of the antifreeze container.
- 4. Dilute the antifreeze solution in accordance with the manufacturer's instructions
- 5. Open all water faucets.
- Insert hose length into the antifreeze container, turn the pump switch on, and run the water pump until the antifreeze solution fills all water lines. Flush toilet. Work hand shower spray while holding down in tub.
- 7. Shut off the pump and close all faucets.

8. Disconnect the hose length from pump inlet fitting and reconnect water system inlet line.

\*VALVES MAY BE ON SIDE OF WATER HEATER

To by-pass the water heater for winterizing, close valves A and C and open valve B (See illustration). Valves may be on top or side of water heater.

### **DRAIN AND WASTE SYSTEM**

Your trailer has a drain and waste system that includes waste-holding tanks made from molded plastic, free from corrosion problems, with trouble-free dump valves.

The MAIN HOLDING TANK enables you to use the toilet for several days away from disposal facilities. The wastewater from the sink, shower, bath and lavatory drains in the AUXILIARY HOLDING TANK. Each tank has its own dump valve, however, both tanks drain through a common outlet. Therefore, you need to make only one connection when hooking up in a trailer park with sewer facilities. The valves are labeled at the handles.

<u>CAUTION</u>: Never put wet strength paper towels or tissues in your holding tank since they won't dissolve and can "catch" in the mechanism of the dump valve. Colored toilet tissue is slower to dissolve than white. Most RV accessory stores offer tissue designed for RVs that will completely dissolve.

#### **Deodorizers**

There are many deodorizers on the market in tablet, liquid and powder form. These not only combat odor, but also stimulate the bacteria that works to dissolve the solids in your tank.

#### **Monitor Panel**

Check your monitor panel frequently. When the BLACK WATER HOLDING TANK is completely full, sewage cannot be emptied from the toilet bowl. If the GRAY WATER HOLDING TANK is overfilled, drain water will "backup" into the tub and cause an unpleasant cleaning job. Never drain the tanks at any place other than an approved dumping station.

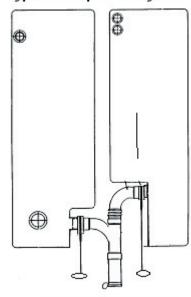

## **Emptying Tanks**

Almost all campgrounds will have dumping facilities. Park directories such as Woodalls and Rand McNally also list dumping stations.

To empty one or both tanks attach the sewer hose by pressing the bayonet fitting onto the dump valve outlet and rotate clockwise until it feels solid and secure. Attach the outlet end of the hose to the sewage outlet; making sure that the hose is placed so it will drain completely.

Pull the dump valve handle as far as it will go and wait until the tank is drained. When dumping, the main holding tank should be dumped first; then the auxiliary holding tank. This will help to rinse out the sewer line with auxiliary holding tank water.

# Typical Dump Valve System

**Dump Valve Handles** 

The main holding tank must be flushed out until all paper and waste material is removed. Close the dump valve and refill the tank with clean water and repeat until clean. Replace the cap prior to traveling.

The main and auxillary tanks are heated by ducting from the furnace. Be sure to follow winterizing instructions for the tanks immediately in freezing temperatures if heat is not being supplied to the trailer.

в

#### **Black Tank Flush**

Inside the utility compartment is a water hose connector for the "black tank flush". To use, hook up a hose and turn on full force. Within the tank a head with multiple holes will spray the interior surface of the tank. The vacuum breaker and check valve will be located inside the trailer above the exterior connection. In most models this will place them under the lavatory.

The gate valve should be closed for the first couple of minutes, and then opened to let the water out in a rush. Repeat as needed.

#### When Parked and Connected to Sewer Outlet

When you are in a park and connected to a sewer outlet keep the main holding tank dump valve closed, and empty the tank every few days or whenever it becomes almost full. ONLY BY SENDING A LARGE VOLUME OF LIQUID THROUGH THE MAIN HOLDING TANK AT A TIME WILL TOILET PAPER AND OTHER SOLIDS COMPLETELY WASH AWAY.

This practice will avoid the accumulation of solids in the main holding tank, which could lead to an unpleasant cleaning job. Should solids accumulate, close the dump valve; fill the tank about half full with water, then tow the trailer for a few miles. The turbulence and surging of the water will usually dissolve the solids into suspension so the tank can be drained. Keep the auxiliary tank valve open when connected to a sewer outlet.

Draining the tanks as described will protect them from freezing during storage. When traveling in sub-freezing temperatures use a winterizing solution designed for RV use. Follow the directions on the container.

#### **Drain Systems Cleaning**

The only cleaning agents that can be used without causing harm to the system are household ammonia and tri-sodium phosphate in small quantities. Do not use any product that contains any portion of petroleum distillates. This attacks the rubber seats of your toilet and dump valve. Also, do not use any dish detergent or abrasive cleaners. All products should be marked approved for ABS drainage systems.

When winterizing drains use only trailer plumbing system type antifreeze. These are sold through your dealer.

### **TOILET**

Manufacturer: Thetford Corporation

Sealand Technology (34' Classic non-slide only)

7101 Jackson Road

13128 State Route 226, P.O. Box38

Ann Arbor, MI 48103

Big Prairie, Oh. 44611

313-769-6000

1-800-321-9866

The RV toilet in your Airstream is a design that has been used for many years. There are two pedals. The large pedal opens and closes the slide mechanism, and the smaller pedal opens and closes a water valve.

In normal use, when you are hooked up to city water, both pedals are depressed together. This dumps the sewage and fresh water and flushes down the side of the bowl. Water will continue to run into the bowl for a short time after the pedals are released.

When you wish to conserve water hold the hand-spray head over the bowl and hold down the thumb-operated lever. Now when you depress the pedal all the water is routed through the hand-spray.

**CAUTION**: When you dump the bowl of the toilet make sure all paper and solids have cleared the slide mechanism before you allow it to close. Failure to do so can cause the groove for the slide to become jammed and the slide will no longer close completely.

If the problem should occur a small nail or bent clothes hanger can be used to "pick" the material out of the groove.

F

# **ELECTRICAL**

# ELECTRICAL OPERATION

The major portion of electrical power in your Airstream is 12-volt. The 12-volt current powers the fans, furnaces, water pump, and water heater ignition. The exception would be the air conditioner and microwave oven.

All 12-volt current comes through the battery system in the front of your trailer. The battery or batteries are accessible from the exterior on the front of your trailer. Power from the battery first goes to a master or "kill" switch inside the trailer.

The kill switch, 12-volt distribution panel, and converter are located under the front sofa on most models. Open the drawer under the sofa seat and look on the roadside of the storage area. The kill switch and distribution panel are mounted on a hinged panel that lowers to access the converter.

On trailers without a front sofa the 12-volt distribution panel and the kill switch is located under the computer table. The converter is located on the roadside front wall and can be accessed by removing cabinet drawers.

The master switch should be left in the ON position except when storing, or a mechanic may use the switch when servicing the trailer.

Power from the main switch continues on to the 12-volt distribution panel, and then to the rest of the trailer. The 12-volt distribution panel has reset circuit breakers and does not require routine servicing. If a short should occur the breaker in that circuit will "click" off and you may notice some lights or appliances losing power. If this should happen, immediately turn the lights and appliances off that are on the shorting circuit and reset the breaker by depressing the small button in the end. If the breaker continues to "click" turn the main power off until a qualified technician can service your trailer.

The charge in the 12-volt batteries is replenished when towing or when plugged into 110-volt city power.

The most common failure in the exterior electrical system is an open circuit. An open circuit is an interruption in the current flow, which may be in either the wire to the component or in the ground return.

Check the following areas for open circuits:

- 1. Light bulb (filament open.)
- 2. Loose or corroded connections at lighting device.
- 3. Loose or corroded connections at 7 way connectors
- 4. Improper grounding at the lighting device.

A continuity light or an ohmmeter will help you isolate the point of the "open" on the circuit. Another cause of failure is a short circuit usually resulting in a blown fuse or cycling circuit breaker at the power source. The wire coming in contact with a sharp edge usually causes a short. The sharp edge wears the wire's insulation away until the "hot" wire short to ground.

Only qualified service centers and technicians should troubleshoot and repair electrical systems.

### 12-VOLT SYSTEM

#### **BATTERY**

**CAUTION:** A normal battery can discharge by itself in 30 to 40 days when not in use, therefore, IT IS NECESSARY TO PERIODICALLY CHECK THE BATTERY AND CHARGE IT AS IS NECESSARY.

We suggest checking the battery at least every two weeks in freezing weather. The temperature at which a battery will freeze depends on the condition of its charge. As an example: a fully charged battery with a specific gravity of 1.265 will not freeze until the electrolyte temperature drops to - 71.3 degrees F, while a discharged battery will freeze at +19 degrees F. The following table shows the freezing points of batteries at various specific gravity readings, temperature corrected 80 degrees F.

Voltage	Freezing point
1.265	-71.3 F
1.250	-62 F
1.200	-16 F
1.100	+5 F
1.150	+19 F

Do not add water to a battery in freezing temperatures unless the vehicle will be put to use at once, otherwise the added water may freeze. Neglect is expensive. Care costs little. Check your batteries regularly.

MAINTAIN A CLEAN BATTERY TOP AND CHECK TERMINALS AND CABLES FOR TIGHTNESS AND CLEANLINESS. A dirty battery will dissipate its charge through surface contamination. Clean battery top with a damp cloth and dry thoroughly.

The terminals should be tight and free of corrosion. To clean terminals, neutralize with a solution of baking soda, rinse in clear water, and dry.

**Note**: Care must be used to make sure soda is not allowed to enter battery cells.

To insure maximum battery capacity on the charge and the discharge, the battery terminals and the inside portion of the cable connector should be scraped or brushed until both of these surfaces are shiny bright. The cable connectors should then be reconnected to the battery and tightened. The complete assembly, battery post and cable connector should be coated with heavy body mineral grease, petroleum grease or petroleum jell.

CAUTION: RECONNECT THE BATTERY CABLES TO THE CORRECT BATTERY POSTS. The black cable should be connected to the negative (-) post and the red cable to the (+) post. The polarity of your tow vehicle must also be negative (-) ground since it must always match the trailer. Most tow vehicles are negative grounded, but always check your vehicle owner's manual to be sure.

ADD WATER TO CELLS AS NECESSARY. Check the electrolyte level at least once a month. When you are traveling steadily and for an extended period of time, or if you are in climates above 90 degrees F, check the electrolyte level about every two weeks.

**CAUTION:** Do not fill battery above the split ring in filler opening. DO NOT MEASURE SPECIFIC GRAVITY IMMEDIATELY after adding water. The water must mix with the electrolyte by charging or by driving a few miles.

# **ELECTRICAL**

WARNING: The gases generated within a storage battery cell may be ignited by an open flame or spark in the vicinity of the battery. Do not use a match or flame to provide light for checking the level of the water.

During the winter the battery should be removed from the trailer and stored in a cool, dry place, where there is no danger of freezing. It should be kept full of water, cleaned and charged monthly. A battery that is allowed to completely lose its charge will never regain its original power or a full charge.

Slide the battery out onto the opened compartment door for service and removal

For battery service or replacement, go to any service station or dealer who sells and services the make battery installed in your trailer.

When being towed, the 12-volt battery in your trailer is receiving a constant charge from the car's generator or alternator through the seven-way connector.

Your tow vehicle's voltage regulator controls the charge rate. It is important to keep the seven-way connector clean. One method is to use "Spra-Kleen".

Whenever possible use the automatic built in converter system for charging. The charging circuit automatically controls the current, reducing it as the battery increases in charge.

At service stations make certain they give your battery a slow charge because quick charges will drastically shorten the life of the battery, as will allowing repeated complete discharges.

# CONVERTER

The converter system is the interior low voltage electrical system that enables you to use the interior lights, fans, pumps and 12-volt appliances whether operating on self-contained battery power or 120-volt city power. The converter provides power to charge the trailer battery and to operate the 12-volt interior electrical system. It is located under the sofa and accessed by opening the sofa drawer. Units with slide-outs have the converter located inside the front cabinet on the roadside accessed by removing the drawers.

The converter provides power to the 12-volt distribution panel by transforming 120-volt alternating current (AC) from the shoreline into 12-volt direct current (DC).

While providing power to the distribution panel, the converter also charges the 12-volt battery system.

The converter is energized only when the trailer is hooked up to 120-volt city power through the shoreline.

# **Converter Testing**

- A. Confirm 120 volt power is going into converter.
- B. Disconnect the 12+ wire from the master switch.
- C. Using a voltmeter check voltage output between heavy positive and negative wires coming out of converter.
- D. The voltage must be within 13.8 and 14.0 volts. (The meter of the tester should be calibrated periodically.)
- E. If converter is not within these voltages, replace it.

### **12V POWER CIRCUITS**

The current in the converter system is 12 volts direct current (12VDC) negative grounded.

Power sources that supply 12VDC current to the system are as follows:

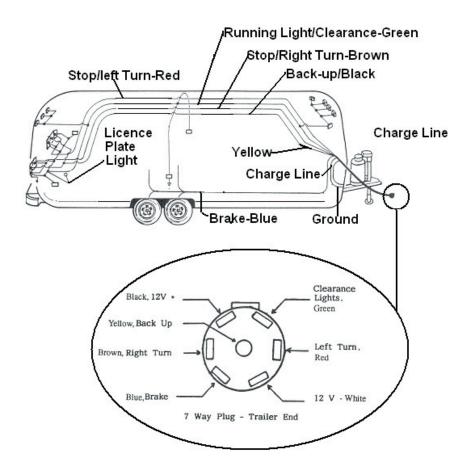

- A. Main charge line from tow vehicle
- B. Trailer Battery
- C. Converter

The power sources above are all electrically connected to the 12-volt distribution breaker panel that distributes current to interior branch circuits. The circuits provide power to operate all 12-volt DC lights, pumps, motors and appliances.

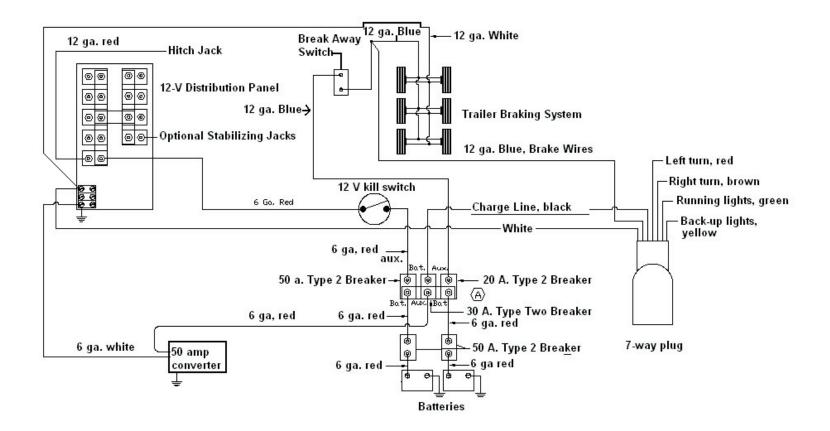

# 12-VOLT EXTERIOR

# 7-Way Harness and Plug

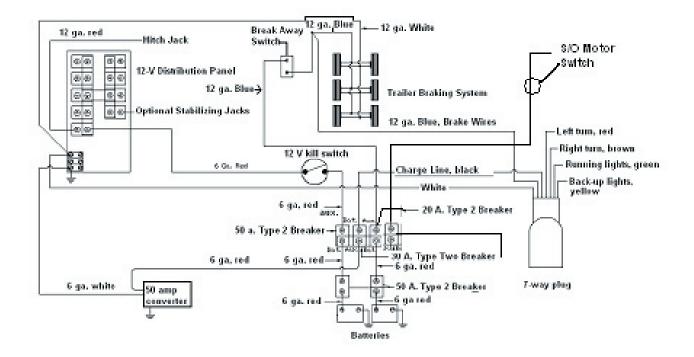

The diagram above match the tow vehicles plug. The 7-way wire is spliced to the main harness on the interior front wall of the trailer. The connection is accessed behind the front sofa in the front of the trailer or by removing front cabinet drawers on slide out models. One of these wires is not spliced onto a wire of the same color. It is the back up wire that is yellow in the cable and black in the harness.

Wire Routing, 7-Way Plug, Battery Charge Line, Distribution Panel

Wire Routing, 7-Way Plug, Battery Charge Line, Distribution Panel, Slide out Models

#### **12-VOLT INTERIOR**

#### **Distribution Panel, USA**

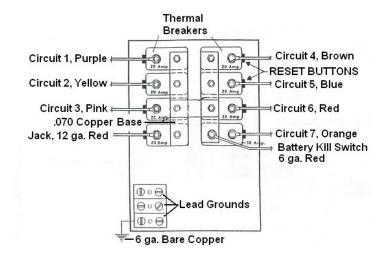

The kill switch, 12-volt distribution panel, and converter are located under the front sofa on most models. Open the drawer under the sofa seat and look on the roadside of the storage area. The kill switch and distribution panel are mounted on a hinged panel that lowers to access the converter.

On trailers without a front sofa the 12-volt distribution panel and the kill switch is located under the computer table. The converter is located on the roadside front wall and can be accessed by removing cabinet drawers.

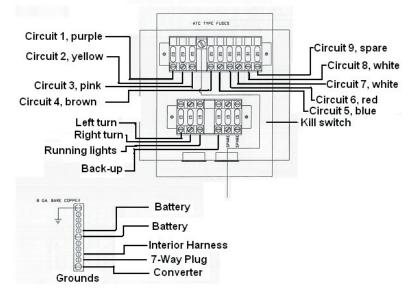

Manual reset breakers protect all the 12-volt circuits. If a breaker trips, an audible click may be heard, and the 12-volt power supply to certain systems will be cut off. The protruding reset button can help identify the questionable breaker.

Reset the breaker by depressing the small rectangular button on the end of the breaker. If the breaker trips a second time, try shutting off an item on that circuit. If the breaker continues to trip the system affected should be checked by a qualified service center.

Canadian panels have automotive type fuses.

#### Canadian 12-Volt Distribution

# G

#### 110-VOLT ELECTRICAL SYSTEM

#### **City Power**

The Airstream converter system enables you to use the lights and appliances whether operating on self-contained battery power or hooked up to 110-volt city power. The 12-volt light bulbs give off the same light as regular household bulbs, so that when operating on self-contained battery power, everything works normally except the 110-volt convenience outlets and 110-volt appliances.

Exterior outlets for 110 volts are located on the curbside exterior wall.

## **CAUTION**: When operating with city power make very certain that the service is 110 volt and not 220 volt.

The converter system is designed to maintain constant output voltages regardless of the variances that occur in city power systems. The transformer design eliminates the need for complex electronic sensing systems to charge the battery, minimizing the possibility of failures and greatly increasing its overall reliability.

**CAUTION**: Your Airstream has a gas electric water heater. Make sure the 110-volt water heater switch in the bathroom is turned off when you plug your trailer in to city power. If your plumbing and water heater are full of water the switch may be left in the on position.

WARNING: When the three-pronged plug can be used there will be no problems with proper polarity or grounding.

In some older parks and other locations where three pronged outlets are not available, certain precautions to insure proper grounding and polarity must be taken. These precautions are listed below:

- Attach the three-pronged plug to a two-pronged adapter. The third conductor line of this adapter has a short wire lead, which must be grounded.
- 2. For proper grounding connect the short ground lead to a grounded outlet box or to a cold water pipe. When no water pipe is available drive a metal rod two feet into the ground and attach the ground lug to it, thus providing the unit with proper grounding. To operate self-contained, simply disconnect the power supply cable.

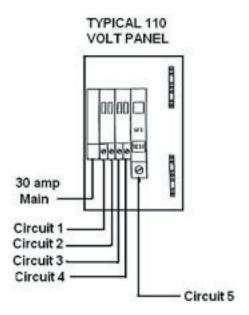

When your trailer is hooked up to 110 volt AC the converter system automatically charges the trailer batteries and, if the 7-way connector is hooked up, your tow vehicle battery as well. The speed and degree of charge depends on how much power is used for lights and appliances, as only the surplus goes to charging the battery. If you are making an extended stay, then you should, if it is available, keep your trailer hooked up to a 110 volt current.

Circuit breakers for the 110-volt system are located in the roadside rear corner of the trailer in the overhead cabinet.

While you are connected to the 110-volt receptacle the wiring is protected by circuit breakers in the breaker panel. In the event of a failure of a 110-volt circuit check your circuit breakers first. If a breaker continues to trip after you have reset it several times, your circuit may be overloaded with appliances or there may be a short in the circuit, The 110-volt switch on the water heater, with its 12 amp draw, would be one of the easiest places to reduce the load on 110-volt circuits. If lessening the load does not solve the problem consult an Airstream Service Center.

The 110-volt electrical system provides power to operate the air conditioner, converter and 110-volt receptacles for portable appliances. The power is carried through the 110-volt city power flexible cord to the 110-volt distribution panel, and then is distributed to each appliance or receptacle.

All wire, components, and wiring methods conform to federal and state requirements.

#### 30 amps Service

Circuit 1, 20 amps A/C Circuit 2, 20 amps, Bedroom, converter Circuit 3, 15 amps, Water Heater Circuit 4, 20 amps, Microwave

Circuit 5, GFI, Galley, Lavatory, Exterior

Outlet, Dinette, Lounge

#### 50 Amp Service (Different Panel)

Circuit 1, 15 amps Water Heater

Circuit 2, 20 amps, Front A/C, Bedroom,

Circuit 3, 20 amps, Converter

Circuit 4, 20 amps, Microwave

Circuit 5, GFI, Galley, Lavatory, Exterior

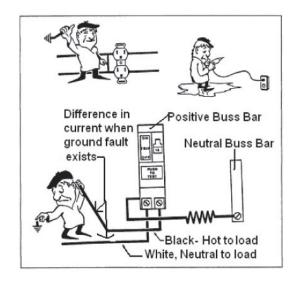

Outlet, Dinette, Lounge

Circuit 6, 20 Amps, Rear A/C

Circuit 7, 20 Amps, Bedroom TV

The breaker panel in your trailer has a label installed to designate circuit specific to the trailer.

Airstream installs a ground fault circuit interrupter to protect several outlets on the trailer.

When properly installed, the GFCI circuit breaker provides reliable overload and short circuit protection PLUS protection from Ground Faults that might result from contact with a "HOT" load wire and ground.

**IMPORTANT NOTE**: The GFCI circuit breaker will NOT reduce shock hazard if contact is made between a "HOT" load wire and a neutral wire or 2 "HOT" load wires.

Each GFCI circuit breaker is calibrated to trip with a ground current of 5 milliamperes or more. Since most persons can feel as little as 2 milliamperes, a distinct shock may be felt if the need for protection exists. However, the shock should be of such short duration that the effects would be reduced to less than the normally dangerous level. However, persons with acute heart problems or other conditions that can make a person particularly susceptible to electric shock may still be seriously injured.

While the GFCI circuit breaker affords a high degree of protection, there is no substitute for the knowledge that electricity can be dangerous when carelessly handled or used without reasonable caution.

WARNING: The GFCI circuit breaker provides protection only to the circuit to which it is connected. It does NOT provide protection to any other circuit.

#### OCCUPANT:

Make this test each month and record the date on the chart.

- 1. With the breaker switch in the "ON" position, press PUSH TO TEST button.
- The breaker switch should move to TRIP position, indicating that GFCI breaker has opened the circuit.
- 3. To restore power push the breaker switch to the "OFF" and then raise it to "ON

<u>Important</u>: If the breaker switch does not move to TRIP position when test button is pressed, the GFCI breaker protection is not complete. If this happens, replace GFCI breaker.

#### Remote Generator Hook Up (optional equipment)

The remote generator hook up will be located on the front plate of the trailer just behind the LPG bottles. A generator can be plugged into the 110-volt system using this plug and a power cord supplied separately with this option.

The system includes a automatic transfer switch to prevent a power overload if a generator is started while the trailer's 110-volt shoreline is plugged into a 30 amp service. The transfer switch will automatically switch power from a shoreline source to a generator when it senses power entering the switch from the generator. When power is cut from the generator, the switch returns to the shoreline as its power source.

A minimum of 5.5 KW with a 30-amp breaker will be required to sufficiently power the 30 amp service.

#### **INVERTOR** (option)

The Inverter powers the TV and one additional labeled 110 volt receptacle. The inverter converts 12 volt electricity from your batteries into 110 volt power. The switch for the inverter is locatedunder the monitor panel. Overloading the inverter will cause a automatic shut off to activate. Removing the load will allow the inverter to reset.

#### **Door Bell**

The door bell module is located under the galley flip up shelf on all models except the 34 ', which is located under the dinette table. The module uses 4 "C" batteries. The batteries should be removed during long periods of storage.

G

#### **SATELLITE ANTENNA WIRING**

If you compare the two previous drawings you'll see wiring for a satellite dish antenna is relatively simple.

Units have a faceplate with two coax cable hook-ups. The faceplate has a small coax cable jumper running between the hook-ups to complete the cable TV circuit when in use. To install a satellite system use the following procedure:

### Satellite Jumper Wire

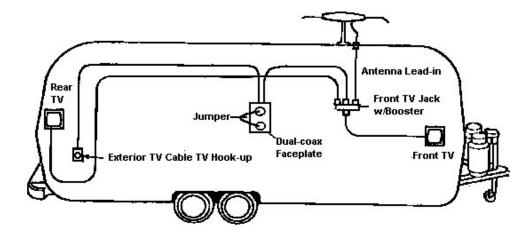

1. Remove the jumper wire from the coax faceplate.

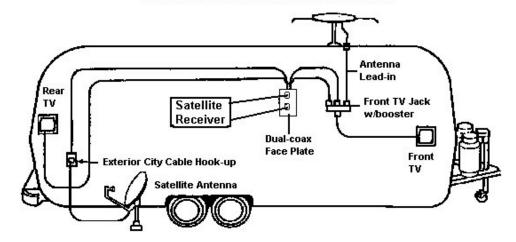

- 2. Hook a portable dish into the Cable TV receptacle in the roadside rear underbelly compartment. This feeds the dish signal to the input side of the faceplate.
- Install the satellite receiver input and output into the dual coax faceplate.

To return to a cable TV system, remove the satellite receiver from the faceplate and reinstall the jumper cable.

#### COAXIAL CABLE WITH CABLE HOOK-UP

#### COAXIAL CABLE WITH SATELLITE ANTENNA

#### SOLAR PANEL

Airstream Travel Trailers are pre-wired for an Intermountain Solar Technology Solar Panel/Chare Controller/Display System. This system may be installed on your trailer as an option. A manual on the use of the system is included with the Airstream Owner's Blue Delivery Case.

Intermountain Solar Technologies 10288 South Jordan Gateway #D South Jordan, UT 84095 800-671-0169

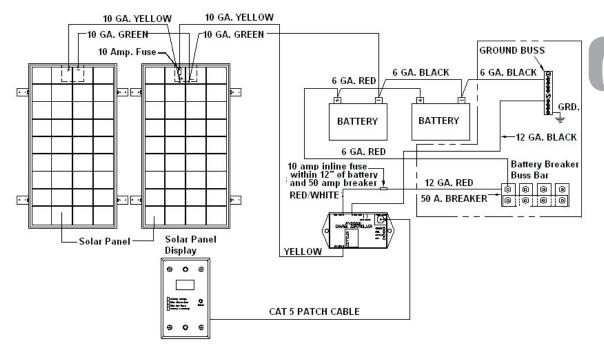

- 1. YELLOW (like the sun) positive and GREEN (like the earth) negative leads runs from battery breaker buss bar area to a harness inside the exterior refrigerator access door. The battery buss bar is located behind the sofa on front lounge models or behind the front cabinets on slide outs, and next to the battery compartment. Battery cables will run to this bar. Roof mounted panels require dropping the panel wires down through the refrigerator vent to the inside of the exterior refrigerator access door. Portable solar panels can be set outside close to the access door. The wires from the solar panel are connected to the positive and negative wires (yellow and green) of the pre-wire system.
- 2. A Cat 5 patch cord for the solar panel display runs from the battery buss bar to an area just below the CatCon monitor display. The solar panel display panel can be mounted just below the CatCon monitor panel by routing the proper size hole. The Cat 5 wire is plugged into the display panel.

**CAUTION**: The Yellow wire must be fused with a 10-amp in-line fuse at the 12-volt positive.

NOTE: All wires are identified with labels at all locations.

The Intermountain solar panel has charge controller that should be mounted close to the battery buss bars as the battery leads are hooked into it to sense the actual battery charge. The Cat 5 wire plugs into it also.

The following drawing is the way Airstream wires the system on factory installed units and is the recommended wiring for use of the pre-wire system.

G

#### **TV ANTENNA**

Manufacturer:

Winegard Company

3000 Kirkwood Street

Burlington, Iowa 52601

Phone: 800-843-4741

#### **Raising Antenna to Operating Position**

### Raising Antenna

**Rotating Antenna** 

Lowering Antenna

Turn elevating crank in "UP" direction until some resistance to turning is noted. Antenna is now in operating position.

#### **Rotating Antenna**

Make sure antenna is in "UP" position. Pull down on directional handle with both hands until it disengages ceiling plate and rotate for best picture and sound on television set.

#### **Lowering Antenna to Travel Position**

Rotate antenna until pointer on directional handle aligns with pointer on ceiling plate.

Turn elevating crank in the "Down" direction until resistance is noted. Antenna is now locked in travel position.

## TV Outlet W/Booster

**NOTE**: The TV Booster must be on to receive antenna signals and off for cable TV operation.

LAVATORY EXHAUST FAN W/POWER LIFT LID

The lavatory may have an exhaust fan that is operated by two wall switches. One switch will open the power lift lid and the other will operate the fan.

**SHOWER FAN** 

The round bath exhaust is operated by pushing up on the handle to raise the fan lid. A push button switch will activate the fan.

HIGH VOLUME ROOF VENT

Manufacturer: FAN-TASTIC VENT CORP.

4349 S. Dort Hwy. Burton, MI 48529 1-313-742-0330 1-800-521-0298

Airstream installs two types of fans. One has the switch mounted on the fan, the other has the switch mounted on the wall. The optional High-volume roof vent system is designed to quickly exhaust stale, hot air and draw in fresh air. It's great to use when the outside temperature really doesn't call for air conditioning, but heat has built up in your coach.

**OPERATING INSTRUCTIONS** 

(switch mounted on fan):

Open a window or door for airflow, source of airflow is determined by the window(s) or door(s) opened. For best results, close all roof vents and open 1 (one) window the greatest distance from your Fan-Tastic Vent ceiling fan.

- Activate appliance by rotating SPEED CONTROL knob to desired performance lever (3-Low, 2-Medium, 1-High, O-Off)
- 2) Open dome approx. 3" or more with the DOME rocker switch (ceiling fan has a built in safety switch that will not allow motor to operate unless dome is partially open).
- 3) Select desired temperature or comfort level by rotating the THERMOSTAT knob. Fan motor will now start & stop automatically as interior temperature of coach exceeds or drops below selected level.

NOTE: Fan motor will not start if temperature selected is warmer than interior temperature of coach.

4) Turn the POWER rocker switch on.

<u>CAUTION</u>: Never place Lindeen™ or a like cover over ceiling fan. Greatly restricted airflow & increased sound levels will occur.

A built-in manual knob can be used to close the dome in an emergency, to adjust the dome to a desired partially open level or to override the rain sensor.

OPERATING INSTRUCTIONS (Wall Mounted switch)

Operating instructions are basically as above except

Dome will lift automatically when appliance is turned
on using the wall switch and the Thermostat is also
located on the wall by the Power switch.

#### **CLEANING INSTRUCTIONS:**

- 1) Turn fan motor Off.
- 2) Remove 8 painted flathead Phillips screws around perimeter of screen insert only.
- 3) Clean screen with soap & water solution and reinstall.

#### **BACK UP CAMERA PRE-WIRE**

Your trailer has a 2-pin power connector pre-wired into the running light 12-volt system for the installation of a Power Line Vision System made by Power Linx. For more information on this system contact PowerLinx at their website or call http://rvenjoyment.com/rearview.htm.

#### **EXTERNAL RADIO JACK (Optional)**

Your trailer may have wireless external speaker jacks. they are llocated on the underbelly just below the rubrail trim close by the exterior 110-volt outlet.

#### **SATELLITE RADIO (OPTION)**

The travel trailer may be equipped with a satellite radio.

This system is integrated with the entertainment system on the trailer. The system owner's manual is included

G

#### MONITOR PANEL

Micropulse Systems Monitor
CATCON PRODUCTS INC.
817-921-2188
techsupport@catconproducts.com

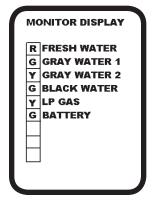

The MicroPulse System makes use of a single solidstate sensor per tank. The MicroPulse sensor measures the static (head) pressure at the bottom of the tank and transmits this information to the MicroPulse System Monitor. Knowing this pressure value, after a onetime calibration has been performed, the MicroPulse System will calculate and accurately display the tank level in 1/8 increment.

A single sensor is installed on the sidewall of each tank, near the bottom, via a 3/4" female NPT spin-in thread. The sensor is solid state, there are no moving parts to wear or maintain. Because the principle of operation does not involve any electrical current flow through the tanks contents (conducted or induced), the nature of the fluid in the tank is unimportant.

The monitor system has been calibrated at the factory and should never need another calibration. If you feel the system is not operating correctly, please contact CATCON Products or a local Airstream dealer. The following instructions are provided for qualified service technicians.

## MICROPULSE SYSTEMS MONITOR OPERATION INSTRUCTIONS

This example shows the monitor reporting the following:

Fresh Water = 1/8 to Empty
Gray Water 1 = Empty to 5/8
Gray Water 2 = 3/4

Black Water = Empty to 5/8

LP Gas = 1/4

Battery = Empty to 5/8

On all diagrams the Letters R=Red, Y=Yellow, G=Green, Blank=no LED lit.

#### **NORMAL OPERATION**

The MicroPulse Monitor will display the condition of each system at all times. The tri-color LED beside the system will indicate the condition of the system using the following color code.

Fresh Water, LP Gas, Battery are as follows:

Green LED = 3/8 to Full

Yellow LED = 1/4

Red LED = 1/8 to Empty

Gray Water, Black Water are as follows:

Green LED = Empty to 5/8

Yellow LED = 3/4

Red LED = 7/8 to Full

#### TO OBTAIN EXACT READING

To obtain an exact reading of all systems press and release the status button one time. The monitor will flash the LED beside the system it is about to report. It will than display the exact condition of that system by lighting the bar graph from Empty to Full. The monitor will display the exact condition of each system and then return to normal operation mode.

To obtain an exact reading of an individual system press and release the status button until the LED beside the system that you want the condition of is lit. Release the status button and the monitor will display the exact condition of that system by lighting the bar graph from Empty

#### **APPLIANCES**

All appliances are delivered to Airstream Inc. with in depth Owner's Manuals. Those manuals are included in the delivery case supplied by your dealer. The manuals may contain warnings, cautions, and operating instruction that should be read and followed before operating the appliances. The information contained in the appliances manuals supersedes any information contained in the Airstream Trailer Owner's Manual on appliances. If you believe contradictory information on appliances is contained in this manual, please contact the Airstream Customer Service Department at 937-596-6111 or write:

Airstream Factory Service Center P.O. Box 629 419 W. Pike Street Jackson Center, Ohio 45334-0629 937-596-6111

If any appliance manuals have not been provided with your trailer, contact your dealer, the respective appliance manufacturer or Airstream Customer Service. A manual will be provided to you.

#### **AIR CONDITIONER**

Manufacturer: Dometic Sales Corporation

2320 Industrial Parkway P.O. Box 490

Elkhart, IN 46515

Phone: 219-295-5228

**Note**: Review the air conditioning literature supplied in your Owner's Packet before proceeding.

The roof air conditioner used on Airstream trailers is one of the most popular on the market today. In your Owner's Packet is a set of literature covering all operating and maintenance instructions. If the literature is misplaced please contact the air conditioner manufacturer or your Airstream dealer for replacement.

The voltage to the air conditioner is critical. We commonly refer to 110 or 120 volts, but a check with a voltmeter may find voltage much lower. Your air conditioner will probably not function if the current drops below 105 volts. Low voltage is usually associated with older or poorly maintained trailer parks, but many people have found their homes, built only twenty or thirty years ago, may not be capable of operating the air conditioner on some receptacles, Parking your motorhome so the power cord can be plugged into a receptacle close to the fuse or circuit breaker box can alleviate the problem. Avoid extension cords and adapters whenever possible. If an extension cord must be used it should be as short and heavy as possible to provide the most current to the air conditioner.

If high temperatures are expected, you should make an effort to park in a shaded area. Starting the air conditioner early in the morning also helps. It is much easier to hold a comfortable temperature than it is to lower the temperature after the interior of the trailer is already hot.

#### **FURNACE**

Manufacturer: Hydro Flame Corporation 1874

South Pioneer Road
Salt Lake City, UT 84104
Phone: 801-972-4621

The manufacturer of the furnace in your trailer is well known in the RV industry. The furnace burns LP gas, and is powered by 12 volt current from the battery or power converter when plugged into city power. Operating instructions are located in your Owners Packet. If they should become misplaced new literature can be ordered direct from the manufacturer or your Airstream dealer. The manufacturer also offers a detailed service quide for your furnace.

WARNING: Carefully read all the manufacturer's instructions prior to operating. NEVER store flammable material next to the furnace.

If warranty service is required use only a service location recommended by the furnace manufacturer or your Airstream dealer.

#### **RANGE**

Manufacturer: Magic Chef

28812 Phillips Street Elkhart, Indiana 46514 219-264-9578

People using gas ranges in their home will find little difference in the operation of the range in the trailer.

Other customers, used to electric ranges may be a little apprehensive at first; but will quickly gain confidence. The basic operation of the gas ranges have been the same for many years, but please be sure to read all the directions furnished by the manufacturer and located in the Owner's Packet. Excellent service and parts manuals are available from the manufacturer.

WARNING: The operation manual for the range is titled "Maytag RV Cooking Appliances". If this has not been provided with your trailer, contact the manufacturer listed at the top of the page to obtain. Their manual contains specialized warnings and cautions that should be reviewed prior to operating the appliance.

#### **MICROWAVE OVENS**

Manufacturers: Dometic Sales Corporation

2320 Industrial Parkway

P.O. Box 490

Elkhart, IN 46515

219-295-5228

or

Sharp Electronics Corporation

10 Sharp Plaza

Paramus, New Jersey 07652

201-5112-0055

Only federally certified technicians are permitted to service microwave ovens. For this reason the only service instructions contained in this manual are for removal of the complete oven. If you have a microwave oven problem please contact the appropriate manufacturer, an authorized Airstream dealer, or the Factory Customer Service Department.

Both microwave ovens can be removed for service by removing the screws in the vented trim ring. The trim rings are fastened to microwave oven. After removing the screws, pull straight out on the oven until the 110-volt plug can be unplugged.

#### **REFRIGERATOR**

#### Manufacturer:

Dometic Sales Corporation 2320 Industrial Parkway P.O. Box 490 Elkhart, Indiana 46514

Phone: 219-295-5228

Review all Dometic Literature supplied in your Owner's Packet or stored in the refrigerator prior to operating.

In an absorption refrigerant system ammonia is liquefied in the finned condenser coil at the top rear of the refrigerator. The liquid ammonia then flows into the evaporator (inside the freezer section) and is exposed to a circulating flow of hydrogen gas, which causes the ammonia to evaporate, creating a cold condition in the freezer.

The tubing in the evaporator section is specifically sloped to provide a continuous movement of liquid ammonia, flowing downward by gravity, through this section. If the refrigerator is operated out-of-level when the vehicle is not moving, liquid ammonia will accumulate in portions of the evaporator tubing. This will slow the circulation of hydrogen and ammonia gas, or in severe cases, completely block it, resulting in a loss of cooling.

Any time the vehicle is parked for several hours with the refrigerator operating the vehicle should be leveled to prevent this loss of cooling. The vehicle needs to be leveled only so it is **comfortable to live in** (no noticeable sloping of floor or walls).

When the vehicle is moving the leveling is not critical, as the rolling and pitching movement of the vehicle will pass to either side of level, keeping the liquid ammonia from accumulating in the evaporator tubing.

#### **OPERATION**

The refrigerator requires 12-volt current to operate even if running on LP or 110 volt modes. The 12-volt is used to power the circuit board that directs the refrigerator functions. When running in a mode such as LP, it means the heat source, by far the largest power requirement; to evaporate the ammonia is being provided by an LP Gas burner.

WARNING: Most LP gas appliances used in recreational vehicles are vented to the outside of the vehicle. When parked close to a gasoline pump, it is possible that gasoline fumes could enter this type of appliance and ignite the burner flame, CAUSING A FIRE OR AN EXPLOSION.

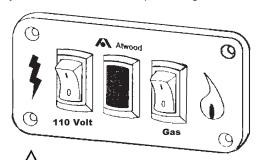

#### **WATER HEATER**

Manufacturer:

Atwood Mobile Products 4750 Hiawatha Drive P.O. Box 1205 Rockford, Illinois 61105

Phone: 815-877-7461

Note: Review the water heater literature supplied in your Owner's Packet before proceeding,

WARNING: Hydrogen gas can be produced in a hot water system served by this heater that has not been used for a long period of time (generally two weeks or more). Hydrogen gas is extremely flammable. To reduce the risk of injury under these conditions, it is recommended that the hot water faucet he opened for several minutes at the kitchen sink before using any electrical appliance connected to the hot water system. If hydrogen is present there will probably be an unusual sound such as air escaping through the pipe as the water begins to flow. There should be no smoking or open flame near the faucet at the time it is open.

#### **Electronic Ignition**

The switches used to light your electronic ignition water heater are located in the bathroom above the lavatory top. When the gas switch is turned on, the red light will come on indicating the "try" mode is in effect. Normally the burner will ignite in just a few seconds, and the light will go out. If your LP system hasn't been used for some time, the system may go into safety lockout (about 20 seconds) before the air is all expelled from the lines. Turning the switch off for 30 seconds, then back on, reinstates the "try" mode.

A second switch for the water heater is also located on the panel. This provides power to the heating element. DO NOT use unless you are sure the water heater is full. (Open a faucet and see if there is a full stream of water on the hot side)

The 110-volt element may be operated at the same time as the gas burner. To operate the 110-volt by itself simply turn the electronic gas igniter switch off.

The heating element is 1500 watts so if breakers start to kick out when the air conditioner cycles you may want to turn the switch off to the heating element.

#### **SAFETY**

If your water system is full and cold and the water heater is ignited the system can see pressures as high as 120 psi before the relief valve starts to open. Since the water system normally operates in the 40-psi range the water expanding does put unusual stress on the system. This normally does not cause any problems, but the stress is easily alleviated. As the water is heating just open any faucet and run as little as a cup of water. Just removing this small amount of water reduces the pressure build up significantly.

For fun, watch the sequence of events your family goes through when you park the trailer and ignite the water heater. More than likely someone will run water and relieve the pressure without even realizing it.

## **SPECIFICATIONS**

#### **SPECIFICATIONS**

Note: All weights were made on prototype vehicles. Your production trailer may vary. For the weight specifications of your trailer read the weight label and check the manufacturing tag on the side of your trailer. For label location, see information under "Loading" section of this manual.

The Unit Base Weight (UBW) and the Net Carrying Capacity (NCC) is not the same as the Unloaded Vehicle Weight (UVW) and the Cargo Carrying Capacity (CCC) shown on the Trailer Weight Information tag in your vehicle.

The UBW and NCC weights are for the base unit with no options and fluids. The UVW and CCC on the Trailer Weight Information tag are weights for the individual vehicle as built with its options and certain water capacities.

Gross Vehicular Weight Rating (GVWR): is the maximum permissible weight of this trailer when fully loaded. It includes all weight at the trailer axle (s) and tongue or pin.

Unit Base weight **(UBW)**: is the dry weight of the base unit with bedroom group and w/o options or fluids.

Net Carrying Capacity (NCC): is equal to GVWR-UBW.

Gross Axle Weight Rating (GAWR): is the value specified as the load carrying capacity of a single axle system, as measured at the tire-ground interfaces.

#### **Axle Alignment:**

Toe In 0 - 1/8" (All Models)

Camber 0 - 1 \_ ° positive (All Models)

#### **Battery**

12 Volt Deep cycle (All Models)

#### **Tire Size**

ST225/75R15 (All Models)

#### Tire Inflation (PSI) Cold

ST225/75RI5 LRD 65 psi

#### \*Hitch Ball Height

The proper height will vary according to the weight you carry and the tires you use. However, checking the height on your trailer is relatively easy:

- With trailer on fairly level ground measure from ground to bottom of frame, front and rear.
- 2. Adjust front jack until measurements are equal
- 3. Now measure from ground to the inside top of ball coupler. This figure is the hitch height. The hitch ball is then usually set \_" to 1" higher, according to the spring weight of your tow vehicle, to allow for it to settle when the trailer is hitched up.
